May 2020
In this paper, we first derived the Ihara zeta function, complexity and zeta Kirchhoff index of the $k$-th semitotal point graph (of regular graphs), a construction by Cui and Hou [5], where we create triangles for every edge in the original graph. Then, we extend the construction to the creation of equilaterals and polygons.

We also derived the zeta Kirchhoff indices for numerous graph transformations on regular graphs, and some selected families of graphs.

At the end, a data summary is provided for enumeration computed on simple connected md2 graphs up to degree 10.

Date Dr. Bill Wood, Thesis Committee Member

Date Dr. Jennifer Waldron, Dean, Graduate College
ACKNOWLEDGEMENTS

I would like to thank Dr. Douglas Mupasiri, for serving on my thesis committee and taking his personal time to teach us real analysis. I have learned to face my weakness in analysis after taking his two analysis sequences.

Most of all, I would like to thank Dr. Marius Somodi, for introducing me to his field of expertise, and for being my thesis advisor as well as chair of the committee. I am extremely grateful for his guidance and support throughout the process of writing this thesis, in which I have received many invaluable insights and suggestions. Also, I would like to thank him for his patience that cannot be underestimated.

I would like to thank Dr. Bill Wood, for reviewing this paper as a member of my committee, and guiding me to think geometrically. I really enjoyed his courses and I see him as a mentor, whom I can seek guidance from.

I would like to acknowledge the assistance of Cindi, Deb and Susan throughout my time here at UNI. We are grateful for their hard work in the math department.

I would like to thank my friends: Abdul here at the math department; Carmen in New York; Jonas in Philadelphia; Jason, Kevin, Mark, Matt, Nitish in Pittsburgh; and Callie in San Francisco, for being considerate and supportive.

Finally, I would like to thank my sister Anastasiya, for consistently bringing a smile to my face, and brightening up my day every time we talk or hang out.

CHAPTER 1
INTRODUCTION

Let \( G = (V_G, E_G) \) be a graph, where \( V_G \) is the set of vertices in \( G \) and \( E_G \) is the set of edges in \( E \). The elements in \( V_G \) consist of ‘points’ in the graph \( G \), whereas the elements in \( E_G \) consist of ‘connections’ that join pairs of vertices in \( V_G \). For example, the graph \( G_1 \) below has \( V_{G_1} = \{a, b, c, d\} \) and \( E_{G_1} = \{ab, ac, ad, bc, cd\} \). The graphs in this paper will have edges that are free of weight and direction, in other words, \( ab = ba \) for each \( ab \in E_G \). Such graphs are called undirected graphs. A subgraph \( H = (V_H, E_H) \) of \( G \) is a graph where \( V_H \subset V_G \) and \( E_H \subset E_G \) such that for each \( v = ab \in E_H \), \( a \in V_H \) and \( b \in V_H \).

![Figure 1.1: Example of a simple graph](image)

We define the order and size of \( G \) to be the number of vertices and edges in \( G \), correspondingly. We also define the degree of any vertex \( v \in V_G \) to be the number of edges \( e \in E_G \) such that \( e = va \) for some \( a \in V_G \). The order of the graph \( G_1 \) above is 4 and its size is 5. The degree of \( a \), \( b \), \( c \) and \( d \) are 3, 2, 3 and 2.

A graph with all vertices of degree 2 or higher is called a minimal degree 2 graph, or md2 graph. Note that it is possible to have an edge that connects the same vertex on both ends; such an edge is called a loop. It is also possible for \( E_G \) to have multiple edges connecting the same vertices. We define a simple graph to be a graph free of loops and multiple edges, and a multigraph to be a graph that contains loops and/or multiple edges. Examples of multigraphs are given below as \( G_2 \) and \( G_3 \). We shall assume all graphs in
Given $v_1, v_n \in V_G$, a walk from $v_1$ to $v_n$ in $G$ is a sequence of edges in the form of $(v_1v_2, v_2v_3, \ldots, v_{n-1}v_n)$ where $v_1v_2, \ldots, v_{n-1}v_n \in E_G$. A trail is a walk without repeated edges, and a cycle is a walk where $v_1 = v_n$. For example, $(ab, bc, cd)$ in $G_1$ is a walk but not a cycle, and $(ab, bc, ca)$ in $G_1$ is a cycle.

A cycle $(v_1v_2, \ldots, v_{n-1}v_n)$ has backtracking if $v_{i+1}v_{i+2} = v_{i+1}v_i$ for some $i$. If $v_{n-1}v_n = v_2v_1$ then we say the cycle has a tail. If a cycle cannot be represented as a power of another cycle (repeating the walk), then we say the cycle is primitive. A primitive cycle that has no backtracks or tails is called a prime cycle.

Two cycles $(v_1v_2, \ldots, v_{n-1}v_n)$ and $(w_1w_2, \ldots, w_{n-1}w_n)$ are equivalent if $v_1v_2 \ldots v_n$ is a cyclic permutation of $w_1w_2 \ldots w_n$. This defines an equivalence relation on the set of all cycles of $G$. Let $[C]$ be the equivalence class of all cycles that are equivalent to a prime cycle $C$. Then, the Ihara zeta function of a graph $G$ is a function of complex argument $u$ defined, for sufficiently small values of $u$, by

$$Z_G(u) = \prod_{[C]} \frac{1}{(1 - u^{v[C]})},$$

where $v[C]$ is the number of edges of a representative $C$ of class $[C]$.

For each pair of vertices $v_i, v_j \in V_G$ of a graph $G$, we call $G$ a connected graph if there exist a walk from $v_i$ to $v_j$. Otherwise, $G$ is called a disconnected graph. The number of components of a graph is defined as the minimum number of partitions of $V_G$ such that
each subgraph in a partition is connected. For example, $G_1$ above is a connected graph
and $G_4$ below is a disconnected graph with 2 components.

![Figure 1.3: Example of a disconnected graph](image)

In this paper, we are mainly working with connected regular graphs, that is, connected graphs with vertices of equal degree. We call a graph $G$ an $r$-regular graph (or graph of regularity $r$) if, for each $v \in V_G$, $|v| = r$. Note that, for a connected $r$-regular graph $G$, where $r \geq 2$ and $n \geq 3$, $G$ is an md2 graph.

For instance, as shown below, $G_5$ is a 2-regular graph and $G_6$ is a 3-regular graph. Note that, if $G$ is an $r$-regular graph with order $n$ and size $m$, then $m = \frac{nr}{2}$.

![Figure 1.4: Examples of regular graphs](image)

Two graphs $G$ and $H$ are isomorphic, if they have the same number of vertices, and there exists a permutation $\rho$ such that for each $ij \in E(G)$, $\rho(i)\rho(j) \in E(H)$.

Note that two graphs of equal regularity $r$ are not necessarily isomorphic. For instance, as shown below, both $G_7$ and $G_8$ are 3-regular graphs, but they are not isomorphic.
Since $G_8$ contains prime cycles of length 3 while $G_7$ does not, $G_7$ and $G_8$ are not isomorphic to one another.

An alternative way of representing a graph is to utilize matrices. If $G = (V_G, E_G)$ where $|V_G| = n$, and let $f : [n] \to V_G$ be any bijective map. Then $G$ can be represented by an adjacency matrix $A_G$, where $a_{ij}$ is the count of $f(i)f(j) \in E_G$. For example, the adjacency matrices for $G_3$, $G_5$ and $G_6$ above can be represented as

$$A_{G_3} = \begin{pmatrix} 0 & 1 & 3 & 1 \\ 1 & 0 & 1 & 0 \\ 3 & 1 & 0 & 1 \\ 1 & 0 & 1 & 0 \end{pmatrix}, \quad A_{G_5} = \begin{pmatrix} 0 & 1 & 0 & 1 \\ 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 1 \\ 1 & 0 & 0 & 1 \end{pmatrix}, \quad A_{G_6} = \begin{pmatrix} 0 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 \end{pmatrix}.$$

It should be noted that there are $n!$ ways to enumerate such a bijective map $f$, hence for $n > 1$ the adjacency matrix is not unique. From now on, we will fix a bijective map $f$ (which means we will label the vertices $v_1, v_2, \ldots, v_n$, in some order and edges of $G$ as $e_1, e_2, \ldots, e_m$). For undirected simple graphs, all adjacency matrices are (i) symmetric, (ii) $a_{ii} = 0$ for each $i \in [n]$, and (iii) all entries must be either 0 or 1. Observe that two graphs $G$ and $H$ are isomorphic if and only if there exists some permutation matrix $P$ such that $A_G = PA_HP^T$.

Throughout this paper, we shall refer to the $i$-row, $j$-column entry of a matrix $A$, as $(A)_{ij}$.
An $n \times n$ degree matrix $D_G$ of a graph $G$ is defined as $d_{ii} = \sum_{k=1}^{n} a_{ik} = \sum_{k=1}^{n} a_{ki}$ and $d_{ij} = 0$ whenever $i \neq j$. A Laplacian matrix $L_G$ of a graph $G$ is defined as $L_G = D_G - A_G$. We now give an important theorem proven by Bass.

**Theorem 1.1** ([2]). The Ihara zeta function of graph $G$ with order $n$ and size $m$, satisfies

$$Z_G(u)^{-1} = (1 - u^2)^{m-n} \det \left( I_n - uA_G + u^2(D_G - I_n) \right),$$

where $I_n$ is the identity matrix of dimension $n$.

An undirected simple graph $G = (V_G, E_G)$ where $|V_G| = n$ and $|E_G| = m$, can also be represented as an $n \times m$ incidence matrix $B_G$, where the rows and columns correspond to the vertices and edges of $G$. We let $b_{ij} = 1$ if $i$ is one of the vertices of edge $j$. For instance, the incidence matrix for $G_6$ above can be represented as

$$B_{G_6} = \begin{pmatrix}
1 & 0 & 0 & 1 & 1 & 0 \\
1 & 1 & 0 & 0 & 0 & 1 \\
0 & 1 & 1 & 0 & 1 & 0 \\
0 & 0 & 1 & 1 & 0 & 1
\end{pmatrix}.$$

(It should be made aware, that some authors define the incidence matrix $B_G$ of any given graph $G$ differently.)

We define the *adjacency spectrum* of graph $G$, denoted $\text{Spec}(A_G)$, to be the set of eigenvalues of $A_G$. Similarly, we define the *Laplacian spectrum* of $G$, denoted $\text{Spec}(L_G)$, to be the set of eigenvalues of $L_G$. The *spectral radius* of a matrix $A$ is defined as $\sup \{|\lambda_1|, \ldots, |\lambda_n|\}$, where $\{\lambda_1, \ldots, \lambda_n\}$ is the set of eigenvalues of $A$. Now, we present a couple of propositions.

**Proposition 1.2** (Perron–Frobenius). Let $G$ be a connected graph. Then the spectral radius of $A_G$ is bounded above by the greatest degree of its vertices.

**Proposition 1.3** ([6]). Let $G$ be an $r$-regular graph of order $n$, then the spectral radius of
$A_G$ is $r$. Furthermore, $r$ is the greatest eigenvalue of $A_G$, with multiplicity equal to the number of components in $G$.

Notice that if $\text{Spec}(A_G) = \{\lambda_1, \ldots, \lambda_n\}$ and $G$ is $r$-regular, then the $\text{Spec}(L_G) = \{r - \lambda_1, \ldots, r - \lambda_n\}$. Hence we have the following corollary.

**Corollary 1.4.** Let $G$ be $r$-regular of order $n$. Then the smallest eigenvalue of $L_G$ is $0$, of multiplicity equal to the number of components in $G$. Furthermore, the spectral radius of $L_G$ is bounded above by $2r$.

If $G$ is connected and contains no cycles, then $G$ is called a tree. For a connected graph $G$, a **minimal spanning tree** is a subgraph that is a tree and contains the minimal possible number of edges that connects all vertices in $G$. The total number of such minimal spanning trees of $G$ is called the **complexity** of $G$, denoted $\tau(G)$ throughout this paper. For example, $\tau(G_5) = 4$.

**Theorem 1.5** (Kirchhoff’s/Matrix-Tree). If $G$ is a connected graph of order $n$, then the complexity of $G$ is given by

$$\tau(G) = \frac{1}{n} \prod_{i=2}^{n} \mu_i,$$

where $\text{Spec}(L_G) = \{\mu_1 = 0, \mu_2, \ldots, \mu_n\}$.

The **resistance distance** between two vertices $v_i$ and $v_j$ is defined as

$$r_{ij} = \frac{\det L_{G}^{ij}}{\tau(G)},$$

where $L_{G}^{ij}$ is the matrix obtained from Laplacian matrix of $G$ by removing the $i$-th, $j$-th columns and rows. Also, let $r_{ii} = 0, \forall i$.

The **Kirchhoff index** of $G$ is defined as

$$Kf(G) = \sum_{1 \leq i < j \leq n} r_{ij}.$$
By Chen and Gutman,

**Theorem 1.6** ([4, 7]). If $G$ is a graph of order $n$, then

$$Kf(G) = n \sum_{i=2}^{n} \frac{1}{\mu_i},$$

where $\text{Spec}(L_G) = \{\mu_1 = 0, \mu_2, \ldots, \mu_n\}$. 

Three other graph invariants were introduced recently, that are also based on resistance distances: (i) the zeta Kirchhoff index [14], given by (for md2 graphs)

$$Kf^z(G) = \sum_{1 \leq i < j \leq n} (d_{ii} - 2)(d_{jj} - 2)r_{ij};$$

(ii) the additive Kirchhoff index [7], given by

$$Kf^+(G) = \sum_{1 \leq i < j \leq n} (d_{ii} + d_{jj})r_{ij};$$

and (iii) the multiplicative Kirchhoff index [4], given by

$$Kf^\times(G) = \sum_{1 \leq i < j \leq n} d_{ii}d_{jj}r_{ij}.$$ 

In this paper, formulas for the zeta Kirchhoff index of various graphs and graph transformations will be derived. Therefore, we will assume from here on that all graphs are md2. It should be noted that, for $r$-regular graphs, $Kf^z(G) = (r - 2)^2Kf(G)$ for $r \geq 2$.

Recall the formula for the Ihara zeta function proven by Bass. By Northshield, the determinant part of that formula satisfies the following.

**Theorem 1.7** ([12]). Let $G$ be a graph of order $n$, size $m$ and $f(u) = \det \left( I_n - uA_G + u^2(D_G - I_n) \right)$. Then,

$$f'(1) = 2(m - n)\tau(G),$$
where $\tau(G)$ is the complexity of $G$.

The zeta Kirchhoff index can be derived by taking this formula a step further:

**Theorem 1.8** ([14]). Let $G$ be a graph of order $n$, size $m$ and $f(u) = \det\left( I_n - uA_G + u^2(D_G - I_n) \right)$. Then,

$$f''(1) = 2\left( Kf^z(G) + 2mn - 2n^2 + n \right)\tau(G),$$

where $\tau(G)$ is the complexity of $G$. 

CHAPTER 2  
MAIN RESULTS  

2.1 k-th semitotal point graph of regular graphs

The $k$-th semitotal point graph (also called triangulation of a graph) is a graph transformation that generates a new graph $R_k(G)$ by adding $k$ vertices for every edge in $G$, such that the vertices are adjacent to both of the vertices incident to that edge in $G$.

![Figure 2.1: Example of $k$-th semitotal point graph $R_k(G)$ of cycle graph $C_4$, where $k = 1, 2$](image)

We shall look at the Ihara zeta function, complexity and zeta Kirchhoff index of this graph transformation on a regular graph $G$.

**Theorem 2.1.** If $G$ is an $r$-regular graph of order $n$, then the Ihara zeta function of the $k$-th semitotal point graph $R_k(G)$ satisfies

$$Z_{R_k(G)}(u)^{-1} = (1 - u^2)^{\frac{n(kr+r-2)}{2}} (1 + u^2)^{\frac{n(kr-2)}{2}} \cdot \prod_{i=1}^{n} \left(1 + ru^2 + kru^4 + ru^4 - u^4 - \lambda_i u(1 + ku + u^2)\right),$$

where $\text{Spec}(A_G) = \{\lambda_1 = r, \lambda_2, \ldots, \lambda_n\}$.

Proof. Note that $n_{R_k(G)} = \frac{n(2+kr)}{2}$ and $m_{R_k(G)} = \frac{nr(1+2k)}{2}$ since $G$ is a $r$-regular graph. By
Theorem 1.1, the Ihara zeta function of $R^k(G)$ satisfies

$$Z_{R^k(G)}(u)^{-1} = (1 - u)^{m_{R^k(G)} - n_{R^k(G)}} \cdot \det \left[ I_{n_{R^k(G)}} - u A_{R^k(G)} + u^2 (D_{R^k(G)} - I_{n_{R^k(G)}}) \right] =$$

$$= (1 - u)^{n(kr + r - 2)/2} \cdot \det \left[ I_{n+km} - u A_{R^k(G)} + u^2 (D_{R^k(G)} - I_{n+km}) \right]. \quad (2.1)$$

Let us denote $M = I_{n+km} - u A_{R^k(G)} + u^2 (D_{R^k(G)} - I_{n+km})$. We proceed similar to the approach used in [5], and write

$$A_{R^k(G)} = \begin{pmatrix} 0_{km} & \Gamma^T \\ \Gamma & A_G \end{pmatrix}, \quad D_{R^k(G)} = \begin{pmatrix} 2I_{km} & 0 \\ 0 & (k + 1)D_G \end{pmatrix},$$

where $\Gamma = (B_G, B_G, \ldots, B_G)$, $B_G$ being the $n \times m$ incidence matrix of $G$ defined in the previous chapter. Note that $\Gamma$ is a $n \times km$ matrix, $\Gamma^T$ is a $km \times n$ matrix and $\Gamma\Gamma^T = k(D_G + A_G)$.

Hence, we have

$$M = \begin{pmatrix} I_{km} & 0 \\ 0 & I_n \end{pmatrix} - u \begin{pmatrix} 0 & \Gamma^T \\ \Gamma & A_G \end{pmatrix} + u^2 \begin{pmatrix} I_{km} & 0 \\ 0 & (k + 1)D_G - I_n \end{pmatrix} =$$

$$= \begin{pmatrix} (1 + u^2)I_{km} & -u\Gamma^T \\ -u\Gamma & I_n - uA_G + u^2[(k + 1)D_G - I_n] \end{pmatrix}.$$
Now we can calculate $\det(M)$ by using the Schur complement:

$$
\det(M) = \det[(1 + u^2)I_{km}]:
\cdot \det \left[ \frac{1}{1+u^2} \left( (1 + ru^2 + kru^4 + ru^4 - u^4)I_n - (u + ku^2 + u^3)A_G \right) \right] =
= (1 + u^2)^{km-n} \det \left[ (1 + ru^2 + kru^4 + ru^4 - u^4)I_n - (u + ku^2 + u^3)A_G \right]. \quad (2.2)
$$

Note that if $\text{Spec}(A) = \{\lambda_1, \ldots, \lambda_n\}$, then $\det(I_n + cA) = \prod_{i=1}^n (1 + c\lambda_i)$ for some nonzero real number $c$.

Therefore, (2.2) is equal to

$$
= (1 + u^2)^{km-n} \prod_{i=1}^n \left[ 1 + ru^2 + kru^4 + ru^4 - u^4 - \lambda_i u(1 + ku + u^2) \right], \quad (2.3)
$$

where $\text{Spec}(A_G) = \{\lambda_1 = r, \lambda_2, \ldots, \lambda_n\}$.

Therefore, by substituting (2.3) into (2.1), we obtain

$$
Z_{R^k(G)}(u)^{-1} = (1 - u^2)^{n(kr-r-2)} (1 + u^2)^{n(kr-2)/2} \cdot \prod_{i=1}^n \left( 1 + ru^2 + kru^4 + ru^4 - u^4 - \lambda_i u(1 + ku + u^2) \right).
$$

□

**Theorem 2.2.** Let $G$ be an $r$-regular graph of order $n$. Then the complexity of its $k$-th semitotal point graph $R^k(G)$ satisfies

$$
\tau(R^k(G)) = 2^{n(kr-2)/2+1}(2 + k)^{n-1} \cdot \tau(G),
$$

where $\tau(G)$ is the complexity of $G$.

Proof. By Theorem 1.7, $f(u) = \det \left[ I_{n+km} - uA_{R^k(G)} + u^2(D_{R^k(G)} - I_{n+km}) \right]$ satisfies

$$
f'(1) = 2(m_{R^k(G)} - n_{R^k(G)})\tau(R^k(G)) =
$$
\[ n(kr + r - 2) \tau(R^k(G)), \] (2.4)

where \( \tau(R^k(G)) \) is the complexity of \( R^k(G) \).

Let \( a(u) = (1 + u^2)^{n(kr - 2) / 2} \) and \( p(u) = \prod_{i=1}^{n} p_i(u) \) where \( p_i(u) = 1 + ru^2 + kru^4 + ru^4 - u^4 - \lambda_i u(1 + ku + u^2) \). Thus, by Theorem 2.1

\[ f(u) = a(u) \prod_{i=1}^{n} p_i(u). \]

By differentiating \( f(u) \) in respect to \( u \) and substituting \( u = 1 \), we obtain

\[ f'(1) = a'(1)p(1) + a(1)p'(1) = \]
\[ = a'(1)p_1(1)p_2(1)\ldots p_n(1) + a(1)\left[p_1'(1)p_2(1)\ldots p_n(1) + p_1(1)p_2'(1)p_3(1)\ldots p_n(1) + \cdots + p_1(1)\ldots p_{n-1}(1)p_n'(1)\right]. \] (2.5)

Note that \( p_1(u) = (u - 1)[(kr + r - 1)u^3 + (kr - 1)u^2 + (r - 1)u - 1] \), so \( p_1(1) = 0 \) (where \( \lambda_i = r \)). Also, \( p_i(1) = (2 + k)(r - \lambda_i) \). Hence (2.5) can be reduced to

\[ f'(1) = a(1)p_1'(1)p_2(1)\ldots p_n(1) = \]
\[ = 2^{n(kr - 2) / 2} \cdot \frac{2(kr + r - 2)}{n} \cdot \prod_{i=2}^{n} (2 + k)(r - \lambda_i) = \]
\[ = 2^{n(kr - 2) / 2 + 1}(kr + r - 2)(2 + k)^{n-1} \prod_{i=2}^{n} (r - \lambda_i). \] (2.6)

Finally we substitute (2.6) into \( f'(1) \) in (2.4) and solve for \( \tau(R^k(G)) \), in which we obtain

\[ \tau(R^k(G)) = 2^{n(kr - 2) / 2 + 1} \frac{(2 + k)^{n-1}}{n} \prod_{i=2}^{n} (r - \lambda_i) = \]
\[ = 2^{n(kr - 2) / 2 + 1}(2 + k)^{n-1} \cdot \tau(G). \]
by Theorem 1.5, as desired. \qed

**Theorem 2.3.** Let $G$ be an $r$-regular graph of order $n$ and let $Kf(G)$ be the Kirchhoff index of $G$. Then the zeta Kirchhoff index of its $k$-th semitotal point graph $R^k(G)$ satisfies

$$K f^z(R^k(G)) = \frac{2(kr + r - 2)^2}{(2 + k)^2} K f(G).$$

Proof. By Theorem 1.8, $f(u) = \det \left[I_{n+km} - uA_R(G) + u^2(D_R(G) - I_{n+km})\right]$, (2.3) satisfies

$$f''(1) = 2 \left(K f^z(R^k(G)) + 2mR^k(G)nR^k(G) - 2n^2R^k(G) + nR^k(G)\right)\tau(R^k(G)) =$$

$$= 2 \left(K f^z(R^k(G)) + \frac{n(2 + kr)(1 + knr + nr - 2n)}{2}\right)\tau(R^k(G)). \quad (2.7)$$

Let $f(u) = a(u)p(u) = a(u)p_1(u)\ldots p_n(u)$ where $a(u) = (1 + u^2)^{n(kr-2)/2}$ and $p_i(u) = 1 + ru^2 + krut + ru^4 - u^4 - \lambda_i u(1 + ku + u^2)$. By differentiating $f(u)$ twice with respect to $u$ and substitute $u = 1$, we have

$$f''(1) = a''(1)p(1) + a(1)p''(1) + 2a'(1)p'(1) =$$

$$= 2a'(1)p'(1) + a(1)p''(1) +$$

$$+ 2a(1)p'_1(1)\left(p'_2(1)p_3(1)\ldots p_n(1) + \cdots + p_2(1)\ldots p_n(1)p'_n(1)\right) =$$

$$= \left(\prod_{i=2}^n p_i\right)\left(2a'(1)p'_1(1) + a(1)p''_1(1) + 2a(1)p'_1(1)\sum_{i=2}^n \frac{p'_i(1)}{p_2(1)}\right) =$$

$$= (2 + k)^{n-1}\left(\prod_{i=2}^n \mu_i\right)2^{n(kr-2)/2+1}\left[-6 + 4n + 4r + 5kr - 2nr - 4knr + knr^2 + k^2nr^2\right] + 4\left(\frac{kr + r - 2}{2 + k}\right)\sum_{i=2}^n \frac{-2 + 2\mu_i + k\mu_i + r + kr}{\mu_i}, \quad (2.8)$$

where $\text{Spec}(L_G) = \{\mu_1 = 0, \mu_2, \ldots, \mu_n\}$. 
By substituting (2.8) into (2.7) and solving for $Kf^*(R^k(G))$, we have

$$Kf^*(R^k(G)) = 2n(1-n)(kr+r-2) + \frac{2n(kr+r-2)}{2+k} \sum_{i=2}^{n} \frac{-2+2\mu_i+k\mu_i+r+kr}{\mu_i} =$$

$$= 2(kr+r-2) \left( \frac{n(kr+r-2)}{2+k} \sum_{i=2}^{n} \frac{1}{\mu_i} \right) =$$

$$= \frac{2Kf(G)(kr+r-2)^2}{2+k},$$

by Theorem 1.6, where $Kf(G)$ is the Kirchhoff index of $G$.

2.2 $k$-th semitotal 2-point graph of regular graphs

It is only natural to wonder how the Ihara zeta function will change if we are to add two vertices instead of one vertex for every edge in $G$.

Let us define the $k$-th semitotal 2-point graph to be a graph transformation that takes graph $G$ and generates a new graph $R^k_2(G)$ by adding two vertices for every edge in $G$ such that each of the vertices incident to that edge in $G$ is adjacent to exactly one of the new vertices, where the new vertices are adjacent to each other. Repeat this process until $2k$ vertices are added for each edge in $G$.

Figure 2.2: Example of $k$-th semitotal 2-point graph $R^k_2(G)$ of cycle graph $C_4$, where $k = 1, 2$
Theorem 2.4. Let $G$ be an $r$-regular graph of order $n$, then the Ihara zeta function of its $k$-th semitotal 2-point graph $R^k_2(G)$ satisfies

$$Z_{R^k_2(G)}(u)^{-1} = (1 - u)^{\frac{knr + nr - 2n}{2}}(1 + u^2 + u^4)^{\frac{knr - 2n}{2}} \cdot \prod_{i=1}^{n} \left(1 + ru^2 + ru^4 + kr u^6 + ru^6 - u^6 - \lambda_i(k u^3 + u + u^3 + u^5)\right),$$

where $Spec(A_G) = \{\lambda_1 = r, \ldots, \lambda_n\}$.

Proof. We first note that in $R^k_2(G)$, there are $n + 2mk$ vertices and $m + 3mk$ edges where $n$ and $m$ are the order and size of the original graph $G$.

By Theorem 1.1, the Ihara zeta function of $R^k_2(G)$ satisfies

$$Z_{R^k_2(G)}(u)^{-1} = (1 - u^2)^m n_{R^k_2(G)}^{-n_{R^k_2(G)}} \det \left(I_{n_{R^k_2(G)}} - uA_{R^k_2(G)} + u^2(D_{R^k_2(G)} - I_{n_{R^k_2(G)}})\right) = (1 - u^2)^{\frac{knr + nr - 2n}{2}} \det \left(I_{n+2km} - uA_{R^k_2(G)} + u^2(D_{R^k_2(G)} - I_{n+2km})\right). \quad (2.9)$$

Let $B_G$ be the $n \times m$ incidence matrix of $G$, and define $C_G$ to be the $n \times 2m$ ‘stretched incidence matrix’ of $B_G$, where we take $B_G$, duplicate each column (placing each duplicate immediately after the original column), then remove the second non-zero entry in the original columns and the first non-zero entry in the duplicated columns. For example, let $A_G$ be a complete graph of order 4, then

$$B_G = \begin{pmatrix} 1 & 0 & 0 & 1 & 1 & 0 \\ 1 & 1 & 0 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0 & 1 & 0 \\ 0 & 0 & 1 & 1 & 0 & 1 \end{pmatrix} \quad \text{and} \quad C_G = \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 1 \end{pmatrix}.$$  

Now we can setup the adjacency and degree matrices of $R^k_2(G)$ as follows

$$A_{R^k_2(G)} = \begin{pmatrix} A_G & \Gamma \\ \Gamma^T & \Phi \end{pmatrix},$$
where $\Gamma = (C_G | \cdots | C_G)$ is a $n \times 2mk$ matrix containing $k$ copies of $C_G$, and $\Phi$ is a $2mk \times 2mk$ square matrix such that

$$
\Phi = \begin{pmatrix}
0 & 1 & & & & \\
1 & 0 & & & & \\
& & 0 & 1 & & \\
& & 1 & 0 & & \\
& & & & \ddots & \\
& & & & & 0 & 1 \\
& & & & & 1 & 0 \\
\end{pmatrix}.
$$

Hence, continuing from (2.9)

$$
\det \left[ I_{n+2km} - uA_{R_2^k(G)} + u^2(D_{R_2^k(G)} - I_{n+2km}) \right] = \\
= \det \left[ \begin{pmatrix} I_n & 0 \\ 0 & I_{2km} \end{pmatrix} - u \begin{pmatrix} A_G & \Gamma \\ \Gamma^T & \Phi \end{pmatrix} + u^2 \begin{pmatrix} (kr + r - 1)I_n & 0 \\ 0 & I_{2km} \end{pmatrix} \right] = \\
= \det \begin{pmatrix} (1 + u^2)(kr + r - 1)I_n - uA_G & -u\Gamma \\ -u\Gamma^T & (1 + u^2)I_{2km} - u\Phi \end{pmatrix}.
$$

(2.10)

Let $\Omega = (1 + u^2)I_{2km} - u\Phi$ from the above matrix (2.10). Note that

$$(1 + u^2)\left( \frac{1+u^2}{1+u^2+u^4} \right) - u\left( \frac{u}{1+u^2+u^4} \right) = 1$$

and that

$$u\left( \frac{1+u^2}{1+u^2+u^4} \right) - u\left( \frac{1+u^2}{1+u^2+u^4} \right) = 0,$$

hence $\Omega$. 

is invertible and

\[
\Omega^{-1} = \begin{pmatrix}
1 + u^2 & -u \\
-u & 1 + u^2 \\
1 + u^2 & -u \\
-u & 1 + u^2 \\
\ddots & \ddots & \ddots & \ddots \\
1 + u^2 & -u \\
-u & 1 + u^2
\end{pmatrix}^{-1}
= \begin{pmatrix}
\frac{1+u^2}{1+u^2+u^4} & \frac{u}{1+u^2+u^4} \\
\frac{u}{1+u^2+u^4} & \frac{1+u^2}{1+u^2+u^4} \\
\frac{1+u^2}{1+u^2+u^4} & \frac{u}{1+u^2+u^4} \\
\frac{u}{1+u^2+u^4} & \frac{1+u^2}{1+u^2+u^4}
\end{pmatrix},
\]

and its determinant is

\[
\det(\Omega) = \left[ \det \left( \begin{pmatrix}
1 + u^2 & -u \\
-u & 1 + u^2
\end{pmatrix} \right) \right]^{km}
= (1 + u^2 + u^4)^{km}.
\]

Therefore, continuing from (2.10), we can calculate the determinant by using the Schur complement of \((1 + u^2)I_{2km} - u\Phi\), where

\[
\det \left[ \begin{pmatrix}
1 + u^2(kr + r - 1) & I_n - uA_G \\
-u\Gamma & -u\Gamma^T
\end{pmatrix} \right] = \left[ \begin{pmatrix}
1 + u^2(kr + r - 1) & I_n - uA_G \\
-u\Gamma & -u\Gamma^T
\end{pmatrix} \right] = \det(\Omega) \cdot \det \left[ \begin{pmatrix}
1 + u^2(kr + r - 1) & I_n - uA_G - u^2\Gamma\Omega^{-1}\Gamma^T
\end{pmatrix} \right] =
\]
\begin{align*}
&= (1 + u^2 + u^4)^{km} \det \left[ (1 + u^2(kr + r - 1)) I_n - uA_G - \\
&\quad - \left( ku^3 \right) I_n + \frac{ku^3}{1 + u^2 + u^4} A_G \right] \\
&= (1 + u^2 + u^4)^{km} \det \left[ \left( \frac{1 + r(u^2 + u^4 + u^6 + ku^6) - u^6}{1 + u^2 + u^4} \right) I_n - A_G \left( \frac{u + ku^3 + u^3 + u^5}{1 + u^2 + u^4} \right) \right] \\
&= (1 + u^2 + u^4)^{km-n} \prod_{i=1}^{n} \left( 1 + r(u^2 + u^4 + u^6 + ku^6) - \lambda_i(u + u^3 + u^5) \right) \cdot \\
&\quad \cdot \prod_{i=1}^{n} \left( 1 + ru^2 + ru^4 + kr u^6 + ru^6 - u^6 - \lambda_i(ku^3 + u + u^3 + u^5) \right) \\
&= (1 + u^2 + u^4)^{km} \det \left[ \right] \\
&= (1 + u^2 + u^4)^{km} \det \left[ \right]
\end{align*}

Now combine (2.9) with (2.11), we have

\begin{align*}
Z_{R^k_2(G)}(u)^{-1} &= (1 - u)^{\frac{knr+nr-2n}{2}} (1 + u^2 + u^4)^{\frac{knr-2n}{2}} \\
&\quad \cdot \prod_{i=1}^{n} \left( 1 + ru^2 + ru^4 + kr u^6 + ru^6 - u^6 - \lambda_i(ku^3 + u + u^3 + u^5) \right).
\end{align*}

\textbf{Theorem 2.5.} Let $G$ be an $r$-regular graph of order $n$, then the complexity of its $k$-th semitotal 2-point graph $R^k_2(G)$ satisfies

$$
\tau(R^k_2(G)) = 3^{\frac{knr}{2}+1} (3 + k)^{n-1} \tau(G),
$$

where $\tau(G)$ is the complexity of $G$.

Proof. By Theorem 1.7, we have

$$
f'(1) = 2(m_{R^k_2(G)} - n_{R^k_2(G)}) \tau(R^k_2(G)),
$$

where $f(u) = \det \left( \right)$.

By (2.4), $f(u) = a(u)p_1(u)p_2(u) \ldots p_n(u)$ where $a(u) = (1 + u^2 + u^4)^{\frac{knr-2n}{2}}$,

$p_i(u) = 1 + ru^2 + ru^4 + kr u^6 + ru^6 - u^6 - \lambda_i(ku^3 + u + u^3 + u^5)$, and

$\text{Spec}(A_G) = \{ \lambda_1 = r, \lambda_2, \ldots, \lambda_n \}$. Note that $p_1(1) = 0$, $p_1'(1) = 3(kr + r - 2)$ and
$p_i(1) = (3 + k)(r - \lambda_i)$. Hence we have

\[
f'(1) = a(1)p'_1(1)p_2(1) \cdots p_n(1) = \\
= 3^{(knr-2n)/2} \left(3(kr + r - 2)\right) \prod_{i=2}^{n} (3 + k)(r - \lambda_i) = \\
= 3^{(knr-2n)/2+1}(kr + r - 2)(3 + k)^{n-1} \prod_{i=2}^{n} (r - \lambda_i).
\]

(2.13)

Now by substituting (2.13) into (2.12) and solving for $\tau(R^k_2(G))$, we have

\[
\tau(R^k_2(G)) = 3^{(knr-2n)/2+1}(3 + k)^{n-1} \prod_{i=2}^{n} (r - \lambda_i) = 3^{(knr-2n)/2+1}(3 + k)^{n-1} \tau(G),
\]

by Theorem 1.5.

**Theorem 2.6.** Let $G$ be an $r$-regular graph of order $n$ and let $Kf(G)$ be the Kirchhoff index of $G$. Then the zeta Kirchhoff index of its $k$-th semitotal 2-point graph $R^k_2(G)$ satisfies

\[
Kf^z(R^k_2(G)) = \frac{3Kf(G)(kr + r - 2)^2}{3 + k}.
\]

Proof. By Theorem 1.8, we have

\[
f''(1) = 2 \left( Kf^z(R^k_2(G)) + 2m_{R^k_2(G)}n_{R^k_2(G)} - 2n^2_{R^k_2(G)} + n_{R^k_2(G)} \right) \tau(R^k_2(G)), \quad (2.14)
\]

where $f(u) = a(u)p_1(u)p_2(u) \cdots p_n(u)$ and $a(u) = (1 + u^2 + u^4)^{knr-2n}$ and

\[
p_i(u) = 1 + ru^2 + ru^4 + kr^6 + ru^6 - u^6 - \lambda_i(ku^3 + u + u^3 + u^5)
\]

as the previous theorem.

Since $p_1(1) = 0$, we have

\[
f''(1) = 2a'(1)p'_1(1)p_2(1) \cdots p_n(1) + a(1)p''_1(1)p_2(1) \cdots p_n(1) + \\
+ 2a(1)p'_1(1) \cdot \sum_{j=2}^{n} \frac{p'_j(1)}{p_j(1)} \prod_{i=2}^{n} p_i(1).
\]

(2.15)
Note that $p'_1(1) = 3(kr + r - 2)$, $p''_1(1) = 6(r(4k + 3) - 5)$, $p_1(1) = (3 + k)(r - \lambda)$, and $p'_i(1) = -6 - 3\lambda_i(3 + k) + 6(2 + k)r$, so

$$f''(1) = 3^{kr - 2} + 1 \left( \prod_{i=2}^n p_i(1) \right) \left[ 2(-5 + 4n + 3r + 4kr - 2nr - 4kr + knr^2 + k^2nr^2) + 
(kr + r - 2) \sum_{j=2}^n \frac{6 + 9\lambda_j + 3k\lambda_j - 12r - 6kr}{(3 + k)(\lambda_j - r)} \right].$$

(2.16)

By substituting (2.16) into (2.14) and solving for $Kf^z(R_k^s(G))$, we get

$$Kf^z(R_k^s(G)) = 3n(1 - n)(kr + r - 2) +
+ \frac{knr + nr - 2n}{3 + k} \sum_{j=2}^n \frac{6 + 9\lambda_j + 3k\lambda_j - 12r - 6kr}{\lambda_j - r} =
= 3n(1 - n)(kr + r - 2) +
+ \frac{knr + nr - 2n}{3 + k} \sum_{j=2}^n \left[ \frac{9(\lambda_j - r)}{\lambda_j - r} + \frac{3k(\lambda_j - r)}{\lambda_j - r} + \frac{6 - 3kr - 3r}{\lambda_j - r} \right] =
= 3n(1 - n)(kr + r - 2) + \frac{n(n - 1)(kr + r - 2)(9 + 3k)}{3 + k} +
+ \frac{n(kr + r - 2)(3kr + 3r - 6)}{3 + k} \sum_{j=2}^n \frac{1}{r - \lambda_j} =
= \frac{3Kf(G)(kr + r - 2)^2}{3 + k},$$

by Theorem 1.6.

2.3 $k$-th semitotal multipoint graph of regular graphs

We will now generalize the semitotal point graph to cases beyond two vertices. Define the $k$-th semitotal $s$-point graph to be a graph transformation that takes graph $G$ and generates a new graph $R_k^s(G)$ by adding exactly $s$ vertices and $s + 1$ edges for every edge in $G$, such that all the new vertices has a degree of 2. One can think of it as adding a
path graph of order $s$ for each edge in $G$, and connect the endpoints of the path graph to the two vertices adjacent to that edge. Repeat this process until $ks$ vertices are added for each edge.

Figure 2.3: Example of $k$-th semitotal 3-point graph $R^k_s(G)$ of cycle graph $C_4$, where $k = 1, 2$

**Theorem 2.7.** If $G$ is an $r$-regular graph of order $n$, then the Ihara zeta function of its $k$-th semitotal $s$-point graph $R^k_s(G)$, where $s \geq 3$, satisfies

$$Z^{-1}_{R^k_s(G)}(u) = (1 - u^2)^{\frac{n + knr - 2n}{2}} \cdot \left( \frac{u^{2s + 2s} - 1}{u^2 - 1} \right)^{\frac{knr}{2}} \cdot \left( \frac{1}{u^{2s + 2s} - 1} \right)^n \cdot \prod_{i=1}^{n} \left[ 1 + u^2 - ru^2 + u^{2s + 2s} - kru^{2s + 2s} - u^{4s + 2s} + ru^{4s + 2s} + kru^{4s + 2s} + \lambda_i(u + ku^{1+s} - ku^{3+s} - u^{3+2s}) \right],$$

where $\text{Spec}(A_G) = \{\lambda_1 = r, \lambda_2, \ldots, \lambda_n\}$.

Proof. We first make the observation that there are $n + kms$ vertices and $m + km(s + 1)$ edges in the graph $R^k_s(G)$. Hence by Theorem 1.1, the Ihara zeta function of $R^k_s(G)$ satisfies

$$Z^{-1}_{R^k_s(G)}(u) = (1 - u^2)^{\frac{n + knr - 2n}{2}} \det \left[ I_{n+kms} - uA_{R^k_s(G)} + u^2(D_{R^k_s(G)} + I_{n+kms}) \right]. \quad (2.17)$$

Let $B_G$ be the $n \times m$ incidence matrix of $G$, and defined $C^s_G$ to be the $n \times ms$
‘stretched incidence matrix’ of $B_G$, similar to the construction in our previous construction for $R^k_2(G)$. We take $B_G$, duplicate each column, remove the lower entry in the first column and the upper entry in the second duplicated column, then insert $s - 2$ empty columns in between them. For example, let $A_G$ be the adjacency matrix of the complete graph of order 3, then

$$B_G = \begin{pmatrix} 1 & 0 & 1 \\ 1 & 1 & 0 \\ 0 & 1 & 1 \end{pmatrix} \quad \text{and} \quad C_G = \begin{pmatrix} 1 & 0 & \ldots & 0 & 0 & \ldots & 0 & 1 & 0 & \ldots & 0 \\ 0 & 0 & \ldots & 0 & 1 & 1 & \ldots & 0 & 0 & 0 & \ldots & 0 & 0 \\ 0 & 0 & \ldots & 0 & 0 & \ldots & 0 & 1 & 0 & \ldots & 0 & 0 & 1 \end{pmatrix}.$$

Thus, we have our adjacency matrix

$$A_{R^k_2(G)} = \begin{pmatrix} A_G \\ \Gamma \end{pmatrix},$$

where $\Gamma = (C_G | \ldots | C_G)$ is a $n \times kms$ matrix containing exactly $k$ copies of $C_G$ and $\Psi$ is a $kms \times kms$ block diagonal matrix such that

$$\Psi = \begin{pmatrix} \psi_s \\ \psi_s \\ \vdots \\ \psi_s \end{pmatrix},$$

where $\psi_s = \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 1 \\ 0 & 1 & 0 \end{pmatrix}$.

More precisely, $\psi_s$ is an $s \times s$ matrix where $(\psi_s)_{ij} = 1$ for $j = i \pm 1$, and $(\psi_s)_{ij} = 0$ otherwise.
Let $M = I_{n+kms} - uA_{R_s^k(G)} + u^2(D_{R_s^k(G)} - I_{n+kms})$ in (2.17), then

\[
M = \begin{pmatrix}
I_n & 0 \\
0 & I_{kms}
\end{pmatrix} - u \begin{pmatrix}
A_G & \Gamma \\
\Gamma^T & \Psi
\end{pmatrix} + u^2 \begin{pmatrix}
(k+1)D_G - I_n & 0 \\
0 & I_{kms}
\end{pmatrix} = \\
\begin{pmatrix}
[1 + (kr + r - 1)u^2]I_n - uA_G & -u\Gamma \\
-u\Gamma^T & \Omega
\end{pmatrix},
\]

where $\Omega = (1 + u^2)I_{kms} - u\Psi$.

Note that $\Omega$ is a diagonal block matrix where

\[
\Omega = \begin{pmatrix}
\omega_s \\
\vdots \\
\omega_s
\end{pmatrix}
\]

where $\omega_s = \begin{pmatrix}
1 + u^2 & -u & 0 \\
-u & 1 + u^2 & -u \\
0 & -u & 1 + u^2 & \ddots \\
& & \ddots & 1 + u^2 & -u & 0 \\
& & & -u & 1 + u^2 & -u \\
& & & 0 & -u & 1 + u^2
\end{pmatrix}
\]

hence

\[
\Omega^{-1} = \begin{pmatrix}
\omega_s^{-1} \\
\vdots \\
\omega_s^{-1}
\end{pmatrix}
\]

More precisely, $\omega_s$ is an $s \times s$ matrix such that

\[
(\omega_s)_{ij} = \begin{cases}
1 + u^2, & \text{for } i = j; \\
-u, & \text{for } j = i \pm 1; \\
0, & \text{elsewhere.}
\end{cases}
\]
By [17], since $\omega_s$ is a tridiagonal matrix, we have

$$
(\omega_s^{-1})_{ij} = \begin{cases} 
(-1)^{i+j}(-u)^{j-i}\theta_{i-1}\phi_{j+1} \theta_s & \text{if } i < j, \\
\theta_{i-1}\phi_{j+1} \theta_s & \text{if } i = j, \\
(-1)^{i+j}(-u)^{i-j}\theta_{j-1}\phi_{i+1} \theta_s & \text{if } i > j,
\end{cases}
$$

where $(\theta_i)_{i=0}^s = \theta_0, \theta_1, \ldots, \theta_s$ and $(\phi_i)_{i=1}^{s+1} = \phi_1, \phi_2, \ldots, \phi_{s+1}$ are sequences defined as

$$(\theta_i)_{i=0}^s = 1, 1 + u^2, 1 + u^2 + u^4, \ldots, \sum_{k=0}^{s} u^{2k}, \text{ and}$$

$$(\phi_i)_{i=1}^{s+1} = \sum_{k=0}^{s} u^{2k}, \sum_{k=0}^{s-1} u^{2k}, \ldots, 1 + u^2, 1.$$

Hence $(\omega_s^{-1})_{ij}$ can be written as

$$
(\omega_s^{-1})_{ij} = \begin{cases} 
u_j - i \left( \sum_{k=0}^{i-1} u^{2k} \right) \left( \sum_{k=0}^{j} u^{2k} \right) & \text{if } i < j, \\
\left( \sum_{k=0}^{i-1} u^{2k} \right) \left( \sum_{k=0}^{j} u^{2k} \right) & \text{if } i = j, \\
\nu_i - j \left( \sum_{k=0}^{j-1} u^{2k} \right) \left( \sum_{k=0}^{i} u^{2k} \right) & \text{if } i > j,
\end{cases}
$$

and the Schur’s complement of $\Omega$ is

$$
[1 + (kr + r - 1)u^2]I_n - uAG - (-u\Gamma)\Omega^{-1}(-u\Gamma^T) =
$$

$$
= [1 + (kr + r - 1)u^2]I_n - uAG - u^2(\Gamma\Omega^{-1}\Gamma^T) =
$$

$$
= [1 + (kr + r - 1)u^2]I_n - uAG - u^2 \left( \begin{array}{c} C_G \cdots C_G \\ \vdots \\ C_G \end{array} \right) \begin{pmatrix} (\omega_s^{-1})_{ij} \\ \vdots \\ (\omega_s^{-1})_{km} \end{pmatrix} \begin{pmatrix} C_G^T \\ \vdots \\ C_G^T \end{pmatrix} \right]_{k \text{ copies}}
$$
\[ [1 + (kr + r - 1)u^2] I_n - uA_G - ku^2 \cdot C_G \begin{pmatrix} \omega^{-1}_s \\ \vdots \\ \omega^{-1}_s \end{pmatrix} C_G^T. \]  

(2.20)

Now, let \( \rho_1, \ldots, \rho_m \) be \( n \times s \) matrices such that \( C_G = (\rho_1 \cdots | \rho_m) \), where each \( \rho_\ell \) has only two nonzero entries of value 1, located on the first and last column on rows corresponding to the incident vertices \( \alpha_\ell \) and \( \beta_\ell \). Hence, we have

\[
C_G \begin{pmatrix} \omega^{-1}_s \\ \vdots \\ \omega^{-1}_s \end{pmatrix} m \text{ copies} \quad C_G^T = \sum_{\ell=1}^m \rho_\ell \omega^{-1}_s \rho_\ell^T = \\
= \sum_{\ell=1}^m \left( \begin{array}{cccc} \vdots & 0 & \cdots & 0 \\ \rho_{\alpha_\ell 1} = 1 & \vdots & & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & \vdots & \cdots & \rho_{\beta_\ell s} = 1 \\ \vdots & 0 & \cdots & 0 \\ \text{s-2 zeros} \end{array} \right) \begin{pmatrix} \omega^{-1}_s & \vdots & \vdots & \omega^{-1}_s \\ \vdots & \vdots & \vdots & \vdots \\ \vdots & \vdots & \vdots & \vdots \\ \omega^{-1}_s & \vdots & \vdots & \omega^{-1}_s \\ \vdots & \vdots & \vdots & \vdots \\ \omega^{-1}_s & \vdots & \vdots & \omega^{-1}_s \\ 0 & \vdots & \vdots & 0 \\ 0 & \vdots & \vdots & 0 \\ 0 & \vdots & \vdots & 0 \\ \text{m-2 zeros} & \cdots & \rho_\ell^{T \alpha_\ell} = 1 & \cdots & 0 \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ \cdots & 0 & \cdots & \rho_\ell^{T \beta_\ell} = 1 & \cdots \end{pmatrix} \\
= \sum_{\ell=1}^m \left( \begin{array}{cccc} 0 & \cdots & 0 \\ (\rho_\ell \omega^{-1}_s)_{\alpha_\ell 1} = (\omega^{-1}_s)_{11} & \cdots & (\rho_\ell \omega^{-1}_s)_{\alpha_\ell s} = (\omega^{-1}_s)_{1s} \\ 0 & \cdots & 0 \\ (\rho_\ell \omega^{-1}_s)_{\beta_\ell 1} = (\omega^{-1}_s)_{s1} & \cdots & (\rho_\ell \omega^{-1}_s)_{\beta_\ell s} = (\omega^{-1}_s)_{ss} \\ 0 & \cdots & 0 \end{array} \right) \begin{pmatrix} \rho_1^{T \alpha_\ell} = 1 & \cdots & 0 & \cdots \\ 0 & \cdots & 0 & \cdots \\ \cdots & \cdots & \cdots & \cdots \\ 0 & \cdots & 0 & \cdots \\ \cdots & 0 & \cdots & \rho_s^{T \beta_\ell} = 1 & \cdots \end{pmatrix}
\[
\begin{bmatrix}
0 & & & 0 \\
\vdots & (\rho \omega_s^{-1} \rho^T_\ell)_{\alpha_\ell \alpha_\ell} = (\omega_s^{-1})_{11} & \cdots & (\rho \omega_s^{-1} \rho^T_\ell)_{\alpha_\ell \beta_\ell} = (\omega_s^{-1})_{1s} \\
0 & \vdots & \ddots & 0 \\
0 & \vdots & \ddots & 0 \\
\end{bmatrix}, \text{ and by (2.18),}
\]

\[
\begin{bmatrix}
0 & & & 0 \\
\vdots & (\rho \omega_s^{-1} \rho^T_\ell)_{\alpha_\ell \alpha_\ell} = \sum_{s=0}^{u^2(s-1)} \frac{1}{\sum_{k=0}^{u^2k}} & \cdots & (\rho \omega_s^{-1} \rho^T_\ell)_{\alpha_\ell \beta_\ell} = \sum_{s=0}^{u^2(s-1)} \frac{1}{\sum_{k=0}^{u^2k}} \\
0 & \vdots & \ddots & 0 \\
0 & \vdots & \ddots & 0 \\
\end{bmatrix}
\]

\[
= \left( \frac{\sum_{k=0}^{u^2k}}{\sum_{k=0}^{s}} \right) D_G + \left( \frac{u^2(s-1)}{\sum_{k=0}^{s}} \right) A_G,
\]

therefore (2.20) becomes

\[
[1 + (kr + r - 1)u^2] I_n - uA_G - \left[ ku^2 \left( \frac{\sum_{k=0}^{u^2k}}{\sum_{k=0}^{s}} \right) D_G + ku^2 \left( \frac{u^2(s-1)}{\sum_{k=0}^{s}} \right) A_G \right] =
\]

\[
= [1 + (kr + r - 1)u^2] I_n - uA_G - \left( \frac{ku^2(s^2 - 1)}{u^{2+2s} - 1} \right) D_G - \left( \frac{ku^2(s^2 - 1)}{u^{2+2s} - 1} \right) A_G =
\]

\[
= \left( -1 + u^2 - ru^2 + u^{2+2s} - kr u^{2+2s} - u^{4+2s} + ru^{4+2s} + kru^{4+2s} \right) I_n +
\]

\[
+ \left( \frac{u + ku^{1+s} + ku^{3+s} + u^{3+2s} - u^{2+2s} - 1}{u^{2+2s} - 1} \right) A_G.
\]

Now to find \(\det(\Omega)\), we should take advantage of it being a block diagonal matrix,

where

\[
\det(\Omega) = \det \begin{pmatrix}
\omega_s & & \\
& \ddots & \\
& & \omega_s
\end{pmatrix} = \det(\omega_s)^{km} =
\]

\[
\]
\[
\begin{pmatrix}
1 + u^2 & -u & 0 \\
-u & 1 + u^2 & -u \\
0 & -u & 1 + u^2 \\
\vdots & \ddots & \ddots & \ddots \\
0 & -u & 1 + u^2 \\
-1 + u^2 & -u & 0 \\
\end{pmatrix}
\]

which allows us to proceed and calculate \( \det(M) \),

\[
\det(M) = \det(\Omega) \det \left[ (1 + (kr + r - 1)u^2)I_n - uA_G - (-u\Gamma)^{-1}(-u\Gamma^T) \right] = 
\left( \frac{u^{2+2s}-1}{u^2-1} \right)^{km} \cdot 
\det \left[ (-1 + u^2 - ru^2 + u^{2+2s} - kru^{2+2s} - u^{4+2s} + ru^{4+2s} + kru^{4+2s})I_n + 
(u + ku^{1+s} - ku^{3+s} - u^{3+2s})A_G \right] = 
\left( \frac{u^{2+2s}-1}{u^2-1} \right)^{km} \cdot 
\left( \frac{1}{u^{2+2s}-1} \right)^n \cdot 
\prod_{i=1}^{n} \left[ -1 + u^2 - ru^2 + u^{2+2s} - kru^{2+2s} - u^{4+2s} + ru^{4+2s} + kru^{4+2s} + 
\lambda_i(u + ku^{1+s} - ku^{3+s} - u^{3+2s}) \right].
\]

Therefore, by substituting (2.21) back into (2.17) we obtain the Ihara zeta function

\[
Z_{\mathcal{R}_k}(u)^{-1} = (1 - u^2)^{\frac{kr + kr - 2n}{2}} \cdot 
\left( \frac{u^{2+2s}-1}{u^2-1} \right)^{km} \cdot 
\left( \frac{1}{u^{2+2s}-1} \right)^n \cdot 
\prod_{i=1}^{n} \left[ -1 + u^2 - ru^2 + u^{2+2s} - kru^{2+2s} - u^{4+2s} + ru^{4+2s} + kru^{4+2s} + 
\lambda_i(u + ku^{1+s} - ku^{3+s} - u^{3+2s}) \right],
\]
where Spec\((A_G) = \{\lambda_1 = r, \lambda_2, \ldots, \lambda_n\}\).

We will now find the complexity of \(R^k_s(G)\) combinatorically from any graph \(G\), for \(s \geq 1\).

**Theorem 2.8.** Let \(G\) be an graph of order \(n\), size \(m\) and complexity of \(\tau(G)\). Then the complexity of its \(k\)-th semitotal \(s\)-point graph \(R^k_s(G)\) where \(s \geq 1\) satisfies

\[
\tau(R^k_s(G)) = (1 + k + s)^{n-1}(1 + s)^{km-n+1}\tau(G).
\]

Proof. Let complexity of \(G\) be \(\tau(G)\), and let the order and size of \(G\) be \(n\) and \(m\).

We will count the number of spanning trees of \(R^k_s(G)\) in two disjoint sets \(A, B\), where the spanning trees in \(A\) contains some spanning tree of \(G\) as a subgraph while \(B\) do not. Recall that in \(R^k_s(G)\), we create \(k\) unique trails between \(v_i\) and \(v_j\) for every edge \(v_iv_j\) in \(G\). Each trail consist of \(s\) vertices and \(s+1\) edges excluding \(v_i\) and \(v_j\). Note that there are \(1 + s\) ways to disconnect each of these trails.

We know that every element in set \(A\) contains some spanning tree of \(G\) as a subgraph, therefore all of the \(k\) extra trails created must be disconnected. Hence, there are \((1 + s)^{km}\) ways to disconnect the trails and \(\tau(G)\) ways to pick a spanning trees of \(G\). Thus, \(|A| = \tau(G)(1 + s)^{km}\).

For each element in set \(B\), it can only contain a proper subgraph of any spanning tree of \(G\). Since there are \(\tau(G)\) spanning trees of \(G\) and each spanning tree contains \(n - 1\) edges, there are \(\sum_{i=1}^{n-1} \binom{n-1}{i}\) proper subgraphs for each spanning tree of \(G\). Note that \(i\) counts the number of edges that was removed from spanning trees of \(G\), hence we must reconnect the two vertices incident to the edges taken out for each of these proper subgraphs. There are \(k^i\) ways to pick the paths for the removed edges and \((1 + s)^{(k-1)i}\) ways to generate the remaining ‘disconnected trails.’ And for the remaining \(m - i\) edges, there are \((1 + s)^{(m-i)k}\) ways to generate such ‘disconnected trails.’
Hence

\[ |B| = \tau(G) \sum_{i=1}^{n-1} \binom{n-1}{i} k^i(1+s)^{(k-1)i}(1+s)^{k(m-i)} = \]
\[ = \tau(G) \sum_{i=1}^{n-1} \binom{n-1}{i} k^i(1+s)^{km-i} = \]
\[ = \tau(G)(1+s)^{km} \sum_{i=1}^{n-1} \binom{n-1}{i} \left( \frac{k}{1+s} \right)^i = \]
\[ = \tau(G)(1+s)^{km} \left[ (1+k+s)^{n-1} - \binom{n-1}{0} \right] = \]
\[ = \tau(G)(1+s)^{km} \left[ \frac{(1+k+s)^{n-1}}{(1+s)^{n-1}} - 1 \right], \]

and therefore by adding cardinality of the two sets we have

\[ |A| + |B| = \tau(G)(1+s)^{km} + \tau(G)(1+s)^{km} \left[ \frac{(1+k+s)^{n-1}}{(1+s)^{n-1}} - 1 \right] = \]
\[ = \tau(G)(1+s)^{kmn+1}(1+k+s)^{n-1}. \]

\[ \square \]

We also provide an alternative proof that derives the complexity of \( R_k^s(G) \) from the Ihara zeta function of \( r \)-regular graphs. Note that this corollary follows immediately from the preceding theorem but is restricted to \( r \)-regular graphs.

**Corollary 2.9.** Let \( G \) be an \( r \)-regular graph of order \( n \), then the complexity of its \( k \)-th semitotal \( s \)-point graph \( R_k^s(G) \) where \( s \geq 3 \) satisfies

\[ \tau(R_k^s(G)) = (1+k+s)^{n-1}(1+s)^{knr-n+1}\tau(G), \]

where \( \tau(G) \) is the complexity of \( G \).
Proof. By [8, Thm 7.7] and Theorem 1.7, the Ihara zeta function of $R^k_s(G)$ satisfies

$$
\lim_{u \to 1^-} \frac{(1 - u)^{m_{R^k_s(G)} - n_{R^k_s(G)} + 1}}{Z_{R^k_s(G)}(u)^{-1}} = - \frac{1}{2^{m_{R^k_s(G)} - n_{R^k_s(G)} + 1}(m_{R^k_s(G)} - n_{R^k_s(G)})\tau(R^k_s(G))},
$$

(2.22)

where $\tau(G)$ is the complexity of $G$.

Recall that $m_{R^k_s(G)} - n_{R^k_s(G)} = \frac{knr + nr - 2}{2}$, hence the right hand side of (2.22) is equal to

$$
- \frac{1}{2^{\frac{knr + nr - 2}{4} + 1}(knr - nr - 2)\tau(R^k_s(G))}.
$$

(2.23)

As for the left hand side of (2.22), we have

$$
\lim_{u \to 1^-} \frac{(1 - u)^{m_{R^k_s(G)} - n_{R^k_s(G)} + 1}}{Z_{R^k_s(G)}(u)^{-1}} = \lim_{u \to 1^-} \frac{1 - u}{(1 - u^2)^{\frac{knr + nr - 2}{4}} \left(\frac{u^2 + 2s - 1}{u^2 - 1}\right)^{\frac{knr}{2}} \prod_{i=1}^{n} \rho_i},
$$

(2.24)

where

$$
\rho_i = \left[\frac{-1 + u^2 - ru^2 + u^2 + 2s - kr u^2 + 2s - u^4 + 2s + ru^4 + 2s + ku^4 + 2s}{u^2 + 2s - 1}ight] + \left[\frac{\lambda_i(u + ku^{1+s} - ku^{3+s} - u^{3+2s})}{u^2 + 2s - 1}\right].
$$

Note that

$$
\rho_1 = \left[\frac{-1 + u^2 - ru^2 + u^2 + 2s - kr u^2 + 2s - u^4 + 2s + ru^4 + 2s + ku^4 + 2s}{u^2 + 2s - 1}ight] + \left[\frac{r(u + ku^{1+s} - ku^{3+s} - u^{3+2s})}{u^2 + 2s - 1}\right].
$$
\[ (u - 1)(u^{1+s} - 1) \left( -1 - u + ru - u^{1+s} + kru^{1+s} - u^{2+s} + ru^{2+s} + kru^{2+s} \right) \frac{1}{u^{2+2s} - 1}, \]

and

\[
\lim_{u \to 1^{-}} \frac{(u^{1+s} - 1) \left( -1 - u + ru - u^{1+s} + kru^{1+s} - u^{2+s} + ru^{2+s} + kru^{2+s} \right)}{u^{2+2s} - 1} = kr + r - 2.
\]

Hence, (2.24) is reduced to

\[
\lim_{u \to 1^{-}} -1 = 2 \frac{\text{knr}_{n-2}}{2} \cdot \frac{1}{(1 + u)^{\frac{\text{knr}_{n-2}}{2}} \left( \frac{u^{2+2s} - 1}{u^2 - 1} \right)^{\frac{\text{knr}}{2}} \left( kr + r - 2 \right) \prod_{i=2}^{n} p_i}.
\] 

(2.25)

Then, we find the limit of each of the remaining factors in the denominator of (2.25), where

\[
\begin{align*}
\lim_{u \to 1^{-}} (1 + u)^{\frac{\text{knr}_{n-2}}{2}} &= 2 \frac{\text{knr}_{n-2}}{2}; \\
\lim_{u \to 1^{-}} \left( \frac{u^{2+2s} - 1}{u^2 - 1} \right)^{\frac{\text{knr}}{2}} &= (1 + s)^{\frac{\text{knr}}{2}}, \text{ and} \; \\
\lim_{u \to 1^{-}} p_i &= \frac{(r - \lambda_i)(1 + k + s)}{1 + s}.
\end{align*}
\]

Therefore, (2.25) becomes

\[
\begin{align*}
\lim_{u \to 1^{-}} -1 &= 2 \frac{\text{knr}_{n-2}}{2} \cdot \frac{1}{(1 + s)^{\frac{\text{knr}_{n-2}}{2}} (kr + r - 2) \prod_{i=2}^{n} \left( \frac{(r - \lambda_i)(1 + k + s)}{1 + s} \right)} \\
= \frac{-1}{2 \frac{\text{knr}_{n-2}}{2} (1 + s)^{\frac{\text{knr}_{n-2}}{2}} - n+1 (kr + r - 2)(1 + k + s)^{n-1} \cdot n\tau(G)},
\end{align*}
\] 

(2.26)

by Theorem 1.5.

Finally we set (2.26) equal to (2.23) and solve for \( \tau(R^k_s(G)) \), we have

\[
\tau(R^k_s(G)) = 2 \frac{\text{knr}_{n-2}}{2} (1 + s)^{-n+1} (kr + r - 2)(1 + k + s)^{n-1} \cdot n\tau(G)
\]

\[
= \frac{2 \frac{\text{knr}_{n-2}}{2} (1 + s)^{-n+1} (kr + r - 2)(1 + k + s)^{n-1} \cdot n\tau(G)}{2 \frac{\text{knr}_{n-2}}{2} + 1 (knr - nr - 2)}.
\]
As desired. \[ \square \]

We will now derive a generalized formula for the zeta Kirchhoff index of \( R^k_s(G) \) of a regular graph \( G \).

**Theorem 2.10.** Let \( G \) be an \( r \)-regular graph, then the zeta Kirchhoff index of its \( k \)-th semitotal \( s \)-point graph \( R^k_s(G) \) satisfies

\[
Kf^z\left( R^k_s(G) \right) = \frac{Kf(G)(kr + r - 2)^2(s + 1)}{k + s + 1},
\]

where \( Kf(G) \) is the Kirchhoff index of \( G \).

Proof. We partition the set of vertices of \( R^k_s(G) \) into two sets \( A \) and \( B \), where \( A \) consists of vertices created from the graph transform, and \( B \) consists of vertices from the base graph \( G \).

Let \( n_R = n + \frac{knrs}{2} \) be the degree of \( R^k_s(G) \) and let \( r_{ij} \) be the resistance distance between vertices \( i \) and \( j \) in \( R^k_s(s) \). Then, we have

\[
Kf^z\left( R^k_s(G) \right) = \sum_{1 \leq i < j \leq n_R} (d_{ii} - 2)(d_{jj} - 2)r_{ij} = \sum_{1 \leq i < j \leq n_R} (d_{ii} - 2)(d_{jj} - 2)r_{ij} + \sum_{1 \leq i < j \leq n_R} (d_{ii} - 2)(d_{jj} - 2)r_{ij}. \tag{2.27}
\]

Note that if \( i \in A \), then \( d_{ii} = 2 \); and if \( i \in B \), then \( d_{ii} = kr + r \). Hence (2.27) is reduced to

\[
Kf^z\left( R^k_s(G) \right) = \sum_{1 \leq i < j \leq n_R} (kr + r - 2)^2r_{ij}. \tag{2.28}
\]
If \( i, j \in B \) and are incident in \( R^k_s(G) \), then

\[
r_{ij} = \frac{1}{1 + \frac{k}{s+1}} \cdot \bar{r}_{ij} = \frac{s+1}{k + s + 1} \cdot \bar{r}_{ij},
\]

by the law of resistance of circuits in parallel and series, where \( \bar{r}_{ij} \) is the resistance between vertices \( i, j \) in \( G \).

Therefore, (2.28) becomes

\[
Kf^z\left( R^k_s(G) \right) = \sum_{1 \leq i < j \leq n_R} (kr + r - 2)^2 \left( \frac{s + 1}{k + s + 1} \cdot \bar{r}_{ij} \right) = \frac{(kr + r - 2)^2(s + 1)}{k + s + 1} \cdot \sum_{1 \leq i < j \leq n_R} \bar{r}_{ij} = \frac{Kf(G)(kr + r - 2)^2(s + 1)}{k + s + 1},
\]

where \( Kf(G) \) is the Kirchhoff index of \( G \).

\[\Box\]

2.4 Middle graph of regular graphs

The middle graph of a graph \( G \) is the graph \( M(G) \), where the vertices correspond to the edges and vertices of \( G \); two vertices in \( M(G) \) are adjacent if the corresponding vertices or edges are incident in \( G \).

![Figure 2.4: Example of the middle graph of cycle graph \( C_4 \)](image)

The Ihara zeta function and complexity of the middle graph of a regular graph are
given as follows by Kwak and Sato:

**Theorem 2.11 ([10]).** Let $G$ be an $r$-regular graph. Then the Ihara zeta function of its middle graph $M(G)$ satisfies

$$Z_{M(G)}(u)^{-1} = (1 - u^2)^{2(n^2-2)} a(u) \prod_{i=1}^{n} p_i(u),$$

where $a(u) = \left(1 + 2u + (2r - 1)u^2\right)^{m-n}$ and $p_i(u) = \left(1 - (r-2)u + (2r-2)u^2 - (r-1)(r-2)u^3 - u(1 + u + (r-1)u^2)\lambda_i + (r-1)(2r-1)u^4\right)$.

**Theorem 2.12 ([10]).** Let $G$ be an $r$-regular graph. Then the complexity of its middle graph $M(G)$ satisfies

$$\tau(M(G)) = \frac{1}{n} 2^{m-n+1}(r+1)^{m-1} \prod_{i=2}^{n} (r - \lambda_i),$$

where $\text{Spec}(A_G) = \{\lambda_1 = r, \lambda_2, \ldots, \lambda_n\}$.

We can now prove:

**Theorem 2.13.** Let $G$ be an $r$-regular graph of order $n$ with Kirchhoff index $K_f(G)$. Then the zeta Kirchhoff index of its middle graph $M(G)$ satisfies

$$K_f^z(M(G)) = \frac{4K_f(G)(r^2-2)^2 + n(r-2)\left(2 + n(r^2-2)(r+1)\right)}{2(1+r)} = \frac{2(r^2-2)^2}{r+1}K_f(G) + \frac{2(m-n)}{r+1} + (m-n)n(r^2-2).$$

Proof. Let $f(u) = \det \left(I_{n+m} - uA_{M(G)} + u^2(D_{M(G)} - I_{n+m})\right)$. Note that the order of $M(G)$ is $n+m$ and the size of $M(G)$ is $2m + 2m(r-1)$. By Theorems 1.8 and 2.12, we have

$$f''(1) = 2\left(K_f^z(M(G)) + 2m_{M(G)}n_{M(G)} - 2n_{M(G)}^2 + n_{M(G)}\right)\tau(M(G)) =$$
where \( \text{Spec}(A_G) = \{ \lambda_1 = r, \lambda_2, \ldots, \lambda_n \} \).

By Theorem 2.11,

\[
f(u) = a(u) \prod_{i=1}^{n} p_i(u). \tag{2.30}
\]

Note that we have \( a(1) = (2 + 2r)^{m-n}, \ a'(1) = \frac{2r(m-n)(2+2r)^{m-n}}{1+r}, \ p_1(1) = 0, \)
\( p'_1(1) = 2r^2 - 4, \ p''_1(1) = 2(6r^2 - 5r - 2), \) \( p_i(1) = (1 + r)(r - \lambda_i) \) and \( p'_i(1) = 5r^2 - 3r\lambda_i - 4. \)

Therefore by differentiating (2.30) twice we obtain,

\[
f''(1) = a'(1)p'_1(1)p_2(1)\ldots p_n(1) + \left( a'(1)p'_1(1)p_2(1)\ldots p_n(1) + a(1)p''_1(1)p_2(1)\ldots p_n(1) + \right.
\]

\[+ 2a(1)p'_1(1)\left(p'_2(1)p_3(1)\ldots p_n(1) + \cdots + p_2(1)\ldots p_{n-1}(1)p''_n(1) \right) = \]

\[
= 2 \left( \frac{2r(m-n)(2+2r)^{m-n}}{1+r} \right) (2r^2 - 4) \prod_{i=2}^{n} \left( (1 + r)(r - \lambda_i) \right) + \\
+ 2(2 + 2r)^{m-n}(6r^2 - 5r - 2) \prod_{i=2}^{n} \left( (1 + r)(r - \lambda_i) \right) + \\
+ 2(2 + 2r)^{m-n}(2r^2 - 4) \sum_{j=2}^{n} \left( \frac{5r^2 - 3\lambda_j r - 4}{(1 + r)(r - \lambda_j)} \prod_{i=2}^{n} \left( (1 + r)(r - \lambda_i) \right) \right) = \\
= 2^{m-n+1}(1 + r)^{m-n-1} \prod_{i=2}^{n} \left( (1 + r)(r - \lambda_i) \right) \left[ \frac{2r(2r^2 - 4)(m-n)}{1+r} + (6r^2 - 5r - 2) + \\
+ \frac{2r^2 - 4}{1+r} \sum_{j=1}^{n} \frac{5r^2 - 3\lambda_j r - 4}{(1 + r)(r - \lambda_j)} \right] = \\
= 2^{m-n+1}(1 + r)^{m-n-1} \prod_{i=2}^{n} \mu_i \left[ \frac{2r(2r^2 - 4)(m-n)}{1+r} + (6r^2 - 5r - 2) + \\
+ \frac{2r^2 - 4}{1+r} \sum_{j=2}^{n} \frac{3r\mu_j + 2r^2 - 4}{\mu_j} \right] = \\
= 2^{m-n+1}(1 + r)^{m-n-1} \prod_{i=2}^{n} \mu_i \left[ \frac{2r(2r^2 - 4)(m-n)}{1+r} + (6r^2 - 5r - 2) + \\
+ \frac{2r^2 - 4}{1+r} \sum_{j=2}^{n} \frac{3r\mu_j + 2r^2 - 4}{\mu_j} \right]
\]
\[+ \frac{2r^2 - 4}{1 + r} \left(3r(n - 1) + (2r^2 - 4) \sum_{j=2}^{n} \frac{1}{\mu_j}\right) =
\]
\[= 2^{m-n+1}(1 + r)^{m-1} \prod_{i=2}^{n} \mu_i \left[ \frac{2r^3(2m + n) + r^2 + r(5 - 4n - 8m) - 2}{1 + r} + \frac{(2r^2 - 4)^2}{1 + r} \sum_{j=2}^{n} \frac{1}{\mu_j}\right],\]

(2.31)

where \(\text{Spec}(L_G) = \{\mu_1 = 0, \mu_2, \ldots, \mu_n\}\).

By substituting (2.31) into (2.29) and solving for \(K_f^z(M(G))\), we obtain

\[K_f^z(M(G)) = \frac{n}{2} \left[ \frac{2r^3(2m + n) + r^2 + r(5 - 4n - 8m) - 2}{1 + r} + \frac{(2r^2 - 4)^2}{1 + r} \sum_{j=2}^{n} \frac{1}{\mu_j}\right] - (m + n)(2mr - 2n + 1) =
\]
\[= \frac{n \left[ 2r^3(2m + n) + r^2 + r(5 - 4n - 8m) - 2 \right] + K_f(G)(2r^2 - 4)^2}{2(1 + r)} - (m + n)(2mr - 2n + 1) =
\]
\[= \frac{4K_f(G)(r^2 - 2)^2 + n(r - 2)(2 + n(r^3 + r^2 - 2r - 2))}{2(1 + r)},\]

by Theorem 1.6.

\[\square\]

2.5 Quasitotal graph of regular graphs

The quasitotal graph of a graph \(G\) is the graph \(QT(G)\), where the vertices correspond to the edges and vertices of \(G\); two vertices in \(QT(G)\) are adjacent if (i) the corresponding vertices or edges are incident in \(G\), or (ii) the corresponding vertices are not adjacent in \(G\).
The Ihara zeta function and complexity of the quasitotal graph of a regular graph are given as follows:

**Theorem 2.14** ([16]). Let $G$ be an $r$-regular graph with $\text{Spec}(A_G) = \{\lambda_1 = r, \lambda_2, \ldots, \lambda_n\}$. Then the Ihara zeta function of its quasitotal graph $QT(G)$ satisfies

$$Z_{QT(G)}(u)^{-1} = (1 - u^2)^{\frac{n}{2}(r^2 + n - r - 3)} a(u) b(u) p(u)$$

where

$$a(u) = \left(1 + 2u + u^2(2r - 1)\right)^{m-n},$$

$$b(u) = (u - 1) \left(-1 + (-4 + n + r)u + (-3 + 2n + r - 2nr + 2r^2)u^2 + (2 - n - 4r + 2nr)u^3\right),$$

$$p(u) = \prod_{i=2}^{n} \left[1 + (3 - r)u + (-1 + n - \lambda_i r - \lambda_i^2)u^2 + (-5 + 2n - nr + 4r + \lambda_i - \lambda_i n + +2\lambda_i r)u^3 + (n - 2)(2r - 1)u^4\right].$$

We shall denote each factor in the product $p(u)$ as $p_i(u)$. So,

$$p(u) = \prod_{i=2}^{n} p_i(u),$$

where

$$p_i(u) = \left[1 + (3 - r)u + (-1 + n - \lambda_i r - \lambda_i^2)u^2 +$$
\[ + (-5 + 2n - nr + 4r + \lambda_i - \lambda_in + +2\lambda_ir)u^3 + (n - 2)(2r - 1)u^4 \].

**Theorem 2.15** ([16]). Let \( G \) be an \( r \)-regular graph. Then the complexity of its quasitotal graph \( QT(G) \) satisfies

\[
\tau(QT(G)) = \frac{2}{n}(2 + 2r)^{(r-2)}\left(\prod_{i=2}^{n}[\lambda_i - \lambda_i^2 + 2n - \lambda_in - r + \lambda_ir + nr]\right),
\]

where \( \text{Spec}(A_G) = \{\lambda_1 = r, \lambda_2, \ldots, \lambda_n\} \).

We can now prove:

**Theorem 2.16.** Let \( G \) be an \( r \)-regular graph of order \( n \) with

\( \text{Spec}(A_G) = \{\lambda_1 = r, \lambda_2, \ldots, \lambda_n\} \). Then the zeta Kirchhoff index of its quasitotal graph \( QT(G) \) satisfies

\[
Kf^z(QT(G)) = \frac{n(1 - r)(6 - 8n + 2n^2 + 6r - nr - n^2r + 3nr^2 - nr^3)}{2(1 + r)} + \]

\[ + n(r^2 - r + n - 3)\left[\sum_{i=2}^{n} \frac{-6 + \lambda_i - \lambda_in - 3r + 2\lambda_ir + 3nr}{\lambda_i - \lambda_i^2 + 2n - \lambda_in - r + \lambda_ir + nr}\right].\]

**Proof.** Let

\[ f(u) = \det \left( I_{n+m} - uA_{QT(G)} + u^2(D_{QT(G)} - I_{n+m}) \right). \]

By Theorems 1.8, we have

\[
f''(1) = \left( Kf^z(QT(G)) + (m + n)(1 - 2m - 3n + n^2 + nr^2) \right) \tau(QT(G)). \tag{2.32}
\]

By Theorem 2.14,

\[
f(u) = a(u)b(u)\prod_{i=2}^{n} p_i(u). \tag{2.33}
\]

Note that \( a(1) = (2 + 2r)^{m-n}, a'(1) = \frac{2r(m-n)(2+2r)^{m-n}}{1+r}, b(1) = 0, b'(1) = 2(r^2 - r + n - 3), b''(1) = 2(4r^2 + 2nr - 9r + 2n - 4), p_i(1) = \lambda_i - \lambda_i^2 + 2n - \lambda_in - r + \lambda_ir + nr \) and
\[ p_i'(1) = 3\lambda_i - 2\lambda_i^2 + 4n - 3\lambda_i n - 5r + 4\lambda_i r + 5nr - 6. \]

Therefore, by differentiating (2.33) twice, we got

\[
f''(1) = a(1)b''(1)p(1) + 2a'(1)b'(1)p(1) + 2a(1)b'(1)p'(1) =
\]
\[
= 8p(1)\frac{r(m - n)(2 + 2r)^{m-n}(r^2 - r + n - 3)}{1 + r} + 2p(1)(2 + 2r)^{m-n}.
\]
\[
\cdot (4r^2 + 2nr - 9r + 2n - 4) + 4(2 + 2r)^{m-n}(r^2 - r + n - 3)p'(1) =
\]
\[
= 2 \left( \prod_{j=2}^{n} \left( \lambda_j - \lambda_j^2 + 2n - \lambda_j n - r + \lambda_j r + nr \right) \right) (2 + 2r)^{m-n}.
\]
\[
\cdot \left[ \frac{4r(m - n)(r^2 - r + n - 3)}{1 + r} + 4r^2 + 2nr - 9r + 2n - 4 +
\]
\[
+ 2(r^2 - r + n - 3) \cdot \left( \sum_{i=2}^{n} \frac{p_i'(1)}{p_i(1)} \right) \right].
\]

(2.34)

Now, by setting (2.34) equal to (2.32), we obtain

\[
Kf^z(QT(G)) =
\]
\[
= \frac{6n - 12n^2 + 2n^3 + n^2r - 3n^3r - 6nr^2 + 2n^2r^2 + n^3r^2 - 4n^2r^3 + n^2r^4}{2(1 + r)}
\]
\[
+ n(r^2 - r + n - 3) \left( \sum_{i=2}^{n} \frac{p_i'(1)}{p_i(1)} \right) =
\]
\[
= \frac{6n - 12n^2 + 2n^3 + n^2r - 3n^3r - 6nr^2 + 2n^2r^2 + n^3r^2 - 4n^2r^3 + n^2r^4}{2(1 + r)}
\]
\[
+ n(r^2 - r + n - 3) \left( \sum_{i=2}^{n} \frac{-6 + 3\lambda_i - 2\lambda_i^2 + 4n - 3\lambda_i n - 5r + 4\lambda_i r + 5nr}{\lambda_i - \lambda_i^2 + 2n - \lambda_i n - r + \lambda_i r + nr} \right) =
\]
\[
= \frac{n(1 - r)(6 - 8n + 2n^2 + 6r - nr - n^2r + 3nr^2 - nr^3)}{2(1 + r)}
\]
\[
+ n(r^2 - r + n - 3) \left( \sum_{i=2}^{n} \frac{-6 + 3\lambda_i - \lambda_i n - 3r + 2\lambda_i r + 3nr}{\lambda_i - \lambda_i^2 + 2n - \lambda_i n - r + \lambda_i r + nr} \right).
\]

\[
\]

Corollary 2.17. Let \( G \) be an \( r \)-regular graph of order \( n \) with
\[ Spec(L_G) = \{\mu_1 = r, \mu_2, \ldots, \mu_n\}. \] Then the zeta Kirchhoff index of its quasitotal graph
$QT(G)$ satisfies

$$Kf^z(QT(G)) = \frac{n(1-r)(6-8n+2n^2+6r-nr-n^2r+3nr^2-nr^3)}{2(1+r)} + n(r^2-r+n-3)\left[\sum_{i=2}^{n} \frac{(n-2r-1)\mu_i + 2r^2 + 2nr - 2r - 6}{\mu_i(n+r-1-\mu_i) + 2n}\right].$$

2.6 Corona of two regular graphs

A corona $G \circ H$ of two graphs $G$ (order $n$) and $H$ (order $k$) is constructed by taking $G$, making a copy of $H$ for each vertex of $G$, and connecting each vertex in $G$ to all vertices of the corresponding copy of $H$.

Figure 2.6: Example of the corona $G \circ H$ of $G = C_4, H = C_3$

The Ihara zeta function and complexity of $G \circ H$ are given as follows:

**Theorem 2.18 ([15]).** Let $G$ be an $r$-regular graph of order $n$ and let $H$ be an $s$-regular graph of order $k$. Then the Ihara zeta function of the corona $G \circ H$ satisfies

$$Z_{G \circ H}(u)^{-1} = (1 - u^2)^\frac{2(k+s-r-2)}{2}a(u)\left(\prod_{i=2}^{n} p_i(u)\right)\left(\prod_{j=2}^{k} q_j(u)\right),$$
where \( a(u) = (1 - u)(1 - (r + s - 1)u + rsu^2 - s(k + r - 1)u^3) \),
\[
p_i(u) = 1 - (s + \lambda_i)u + (s + r + s\lambda_i - 1)u^2 - s(\lambda_i + k + r - 1)u^3 + s(k + r - 1)u^4,
\]
\[
q_j(u) = (1 - \theta_j u + su^2)^n,
\]
and \( \text{Spec}(A_G) = \{\lambda_1 = r, \lambda_2, \ldots, \lambda_n\} \), \( \text{Spec}(A_H) = \{\theta_1 = s, \theta_2, \ldots, \theta_k\} \).

**Theorem 2.19** ([15]). Let \( G \) be an \( r \)-regular graph of order \( n \) and let \( H \) be an \( s \)-regular graph of order \( k \). Then the complexity of the corona \( G \circ H \) satisfies
\[
\tau(G \circ H) = \tau(G) \prod_{j=2}^{k} (1 + \gamma_j)^n,
\]
where \( \text{Spec}(L_H) = \{\gamma_1 = 0, \gamma_2, \ldots, \gamma_k\} \).

**Theorem 2.20.** Let \( G \) be an \( r \)-regular graph of order \( n \) and let \( H \) be an \( s \)-regular graph of order \( k \). Then the zeta Kirchhoff index of the corona \( G \circ H \) satisfies
\[
Kf^z(G \circ H) = n(s - 1)(k + kns - ks + nr - 2n) + Kf(G)(ks + r - 2)^2 +
+n^2(kr + r - 2)(s - 1)\sum_{j=2}^{k} \frac{1}{1 + \gamma_j},
\]
where \( Kf(G) \) is the Kirchhoff index of \( G \) and \( \text{Spec}(L_H) = \{\gamma_1 = 0, \gamma_2, \ldots, \gamma_k\} \).

Proof. Let \( f(u) = \det \left( I_{nG \circ H} - uA_{G \circ H} + u^2(D_{G \circ H} - I_{nG \circ H}) \right) \). By Theorem 1.8, we have
\[
f''(1) = 2 \left( Kf^z(G \circ H) + n(1 + k)(1 + n(2ks + r - 2)) \right) \tau(G \circ H), \quad (2.35)
\]
and by Theorem 2.18,
\[
f(u) = a(u) \left( \prod_{i=2}^{n} p_i(u) \right) \left( \prod_{j=2}^{k} q_j(u) \right). \quad (2.36)
\]
Note that \( a(1) = 0, a'(1) = -2 + r + ks, a''(1) = 2(-1 + r - 2s + 3ks + rs), \)
\[ p_i(1) = r - \lambda_i, \quad p'_i(1) = -2 - \lambda_i + 2r + ks - \lambda_i s + rs, \quad q_j(1) = (1 + s - \theta_j)^n \text{ and } \]

\[ q'_j(1) = n(2s - \theta_j)(1 + s - \theta_j)^{n-1}. \]

Therefore, from (2.36) we have

\[ f''(1) = \]

\[ = a''(1) \left( \prod_{i=2}^{n} p_i(1) \right) \left( \prod_{j=2}^{k} q_j(1) \right) + \]

\[ + 2a'(1) \left( \prod_{i=2}^{n} p_i(1) \right) (p'_2(1)p_3(1) \ldots p_n(1) + \cdots + p_2(1) \ldots p_{n-1}(1)p'_{n}(1)) + \]

\[ + 2a'(1) \left( \prod_{j=2}^{k} q_j(1) \right) (q'_2(1)q_3(1) \ldots q_k(1) + \cdots + q_2(1) \ldots q_{k-1}(1)q'_{k}(1)) = \]

\[ = \left( \prod_{i=2}^{n} p_i(1) \right) \left( \prod_{j=2}^{k} q_j(1) \right) \left( a''(1) + 2a'(1) \sum_{i=2}^{n} \frac{p'_i(1)}{p_i(1)} + 2a'(1) \sum_{j=2}^{k} \frac{q'_j(1)}{q_j(1)} \right) = \]

\[ = 2 \left( \prod_{i=2}^{n} (r - \lambda_i) \right) \left( \prod_{j=2}^{k} (1 + s - \theta_j)^n \right) \left[ 3ks + rs + r - 2s - 1 + \]

\[ + (ks + r - 2) \sum_{i=2}^{n} \frac{2 - 2r - ks - rs + \lambda_i + \lambda_i s}{\lambda_i - r} + (ks + r - 2) \sum_{j=2}^{k} \frac{n(2s - \theta_j)}{1 + s - \theta_j} \right] = \]

\[ = 2 \left( \prod_{i=2}^{n} (r - \lambda_i) \right) \left( \prod_{j=2}^{k} (1 + s - \theta_j)^n \right) \left[ 1 - 2kn + knr + 2ks - 2ns + k^2 ns + \right. \]

\[ + nrs - ks^2 + kns^2 + (ks + r - 2)^2 \sum_{i=2}^{n} \frac{1}{r - \lambda_i} + (ks + r - 2) \sum_{j=2}^{k} \frac{ns - n}{1 + s - \theta_j} \right]. \tag{2.37} \]

Now we substitute (2.37) and \( \tau(G \circ H) \) (by applying Theorem 2.19) into (2.35). Then by solving for \( Kf^z(G \circ H) \), we obtain

\[ Kf^z(G \circ H) = n(s - 1)(k + kns - ks + nr - 2n) + n(ks + r - 2)^2 \sum_{i=2}^{n} \frac{1}{r - \lambda_i} + \]

\[ + n(ks + r - 2) \sum_{j=2}^{k} \frac{ns - n}{1 + s - \theta_j} = \]

\[ = n(s - 1)(k + kns - ks + nr - 2n) + Kf(G)(ks + r - 2)^2 + \]
\[ + n^2(ks + r - 2)(s - 1) \sum_{j=2}^{k} \frac{1}{1 + \gamma_j}, \]

by Theorem 1.6.

\[
\sum_{j=2}^{k} \frac{1}{1 + \gamma_j}.
\]

2.7 Edge corona of two regular graphs

An edge corona \( G \diamond H \) of two graphs \( G \) (order \( n \)) and \( H \) (order \( k \)) is constructed by taking \( G \), making \( n \) copies of \( H \), then for each edge in \( G \) connects both incident vertices of that edge to all vertices in each copy of \( H \).

\[ \text{Figure 2.7: Example of the edge corona } G \diamond H \text{ of } G = C_4, H = C_3 \]

The Ihara zeta function and complexity of \( G \diamond H \) are given as follows:

**Theorem 2.21** ([15]). Let \( G \) be an \( r \)-regular graph of order \( n \) and size \( m \). Let \( H \) be an \( s \)-regular graph of order \( k \). Then the Ihara zeta function of the edge corona \( G \diamond H \) satisfies

\[ Z_{G \diamond H}(u)^{-1} = (1 - u^2) \frac{n(2kr + ks + 2r - 4)}{4} a(u) \left( \prod_{i=2}^{n} p_i(u) \right) \left( \prod_{j=2}^{k} q_j(u) \right), \]

where \( a(u) = (1 - u) \left[ 1 - (r + s - 1)u + (rs - kr + 1)u^2 - (s + 1)(kr + r - 1)u^3 \right], \)
\[ p_i(u) = 1 - (s + \lambda_i)u + (r + s - k\lambda_i + s\lambda_i)u^2 - (ksr + rs - s + s\lambda_i + \lambda_i)u^3 + \]
\[ + (s + 1)(kr + r - 1)u^4, \]
\[ q_j(u) = \left(1 - \theta_j u + (s + 1)u^2\right)^m, \]

where \( \text{Spec}(A_G) = \{\lambda_1 = r, \lambda_2, \ldots, \lambda_n\} \) and \( \text{Spec}(A_H) = \{\theta_1 = s, \theta_2, \ldots, \theta_k\} \).

**Theorem 2.22** ([15]). Let \( G \) be an \( r \)-regular graph of order \( n \) and size \( m \). Let \( H \) be an \( s \)-regular graph of order \( k \). Then the complexity of the edge corona \( G \circ H \) satisfies

\[ \tau(G \circ H) = 2^{m-n+1}(k + 2)^{n-1} \prod_{i=2}^{k} (\gamma_i + 2)^m \tau(G), \]

where \( \text{Spec}(L_H) = \{\gamma_1 = 0, \gamma_2, \ldots, \gamma_k\} \).

Now we derive the zeta Kirchhoff index:

**Theorem 2.23.** Let \( G \) be an \( r \)-regular graph of order \( n \) and size \( m \). Let \( H \) be an \( s \)-regular graph of order \( k \). Then the zeta Kirchhoff index of the edge corona \( G \circ H \) satisfies

\[ Kf_z(G \circ H) = \frac{1}{(2 + k)^{2(4-2n+nr)/2}} \left( 2kr + krs + 2r - 4 \right) \left( n^2r(k - 1)(2 + k) + \right. \]
\[ + 2n(n - 1)(4 + 2k + s) + 2Kf(G)(2kr + krs + 2r - 4) + \]
\[ + n^2sr(2 + k) \sum_{j=2}^{k} \frac{1}{2 + \gamma_j} \right) + 2n(2 + k)(3krs + 5kr + 4r - 2s + rs - 6) - \]
\[ - \frac{n(2 + kr)(2 - 4n + 2nr + 2k\gamma + kns)}{4}, \]

where \( Kf(G) \) is the Kirchhoff index of \( G \) and \( \text{Spec}(L_H) = \{\gamma_1 = 0, \gamma_2, \ldots, \gamma_k\} \).

Proof. Let \( f(u) = \det \left( I_{nG \circ H} - uA_{G \circ H} + u^2(D_{G \circ H} - I_{nG \circ H}) \right) \). By Theorem 1.8,

\[ f''(1) = 2 \left( Kf_z(G \circ H) + \frac{1}{4} n(2 + kr)(2 - 4n + 2nr + 2k\gamma + kns) \right) \tau(G \circ H). \] (2.38)
By Theorem 2.21, we have

\[ f(u) = a(u) \left( \prod_{i=2}^{n} p_i(u) \right) \left( \prod_{j=2}^{k} q_j(u) \right), \]  

(2.39)

Note that \( a(1) = 0, a'(1) = -4 + 2r + 2kr + krs, \)
\[ a''(1) = 2(-6 + 4r + 5kr - 2s + rs + 3krs), \]
\[ p_i'(1) = -4 - 4\lambda_i - 2k\lambda_i + 6r + 4kr - \lambda_i s + rs + krs, \]
\[ q_j'(1) = (2 + 2s - \theta_j)(2 + s - \theta_j)^{m-1}. \]

By differentiating (2.38) twice with respect to \( u \) and substituting \( u = 1 \), we have

\[
\begin{align*}
  f''(1) &= \left. a''(1) \left( \prod_{i=2}^{n} p_i(u) \right) \left( \prod_{j=2}^{k} q_j(u) \right) \right|_{u=1} + \\
  &+ 2a'(1) \left( \prod_{i=2}^{n} p_i(1) \right) \left( p_2'(1)p_3(1) \cdots p_n(1) + \cdots + p_2(1) \cdots p_{n-1}(1)p_n'(1) \right) + \\
  &+ 2a'(1) \left( \prod_{j=2}^{k} q_j(1) \right) \left( q_2'(1)q_3(1) \cdots q_k(1) + \cdots + q_2(1) \cdots q_{k-1}(1)q_k'(1) \right) = \\
  &= \left( \prod_{i=2}^{n} p_i(1) \right) \left( \prod_{j=2}^{k} q_j(1) \right) \left( a''(1) + 2a'(1) \sum_{i=2}^{n} \frac{p_i'(1)}{p_i(1)} + 2a'(1) \sum_{j=2}^{k} \frac{q_j'(1)}{q_j(1)} \right) = \\
  &= 2 \left( \prod_{i=2}^{n} (k + 2)(r - \lambda_i) \right) \left( \prod_{j=2}^{k} (2 + s - \theta_j)^{m} \right) \cdot \left[ -6 + 4r + 5kr - 2s + rs + 3krs - (2kr + krs + 2r - 4) \frac{4 + 4\lambda_i + 2k\lambda_i - 6r - 4kr + \lambda_i s - rs - krs}{(2 + k)(r - \lambda_i)} + (2kr + krs + 2r - 4) \frac{m(2 + 2s - \theta_j)}{2 + s - \theta_j} \right].
\end{align*}
\]

(2.40)

Now we substitute (2.40), \( \tau(G \circ H) \) (by applying Theorem 2.22) into (2.38) and solve for the zeta Kirchhoff index. We obtain

\[ Kf^z(G \circ H) = \]
\[
\frac{2n(-6 + 4r + 5kr - 2s + rs + 3krs)}{2(4 - 2n + nr)/2} - \\
\frac{2n(2kr + krs + 2r - 4)}{2(4 - 2n + nr)/2(2 + k)} \sum_{i=2}^{n} \frac{4 + 4\lambda_i + 2k\lambda_i - 6r - 4kr + \lambda_i s - rs - krs}{r - \lambda_i} + \\
\frac{2kr + krs + 2r - 4}{2(4 - 2n + nr)/2} \sum_{j=2}^{k} \frac{m(2 + 2s - \theta_j)}{2 + s - \theta_j} - \\
\frac{n(2 + kr)(2 - 4n + 2nr + 2knr + khrs)}{4} = \\
\frac{1}{(2 + k)2(4 - 2n + nr)/2} \left[ (2kr + krs + 2r - 4) \left( n^2r(k - 1)(2 + k) + \\
+ 2n(n - 1)(4 + 2k + s) + 2Kf(G)(2kr + krs + 2r - 4) + n^2sr(2 + k) \sum_{j=2}^{k} \frac{1}{2 + \gamma_j} \right) + \\
+ 2n(2 + k)(3krs + 5kr + 4r - 2s + rs - 6) \right] - \\
\frac{n(2 + kr)(2 - 4n + 2nr + 2knr + khrs)}{4},
\]

by Theorem 1.6. \(\Box\)

### 2.8 Join of two regular graphs

The join \(G + H\) of two graphs \(G\) (order \(n\)) and \(H\) (order \(k\)) is constructed by connecting every vertex in \(G\) to each vertex in \(H\) with \(t\) edges.

![Example of the join \(G + H\) of \(G = C_4\), \(H = C_3\)](image)

The Ihara zeta function of \(G + H\) is given as follows:
Theorem 2.24 ([3]). Let $G$ be an $r$-regular graph of order $n$ and let $H$ be an $s$-regular graph of order $k$ where $\text{Spec}(A_G) = \{\lambda_1 = r, \lambda_2, \ldots, \lambda_n\}$ and $\text{Spec}(A_H) = \{\theta_1 = s, \theta_2, \ldots, \theta_k\}$. Then the Ihara zeta function of the join $G + H$ satisfies

$$Z_{G+H}(u)^{-1} = (1 - u^2)^{\frac{1}{2}}(1 - 2k - 2n + 2kn + nr + ks) a(u) \left( \prod_{i=2}^{n} p_i(u) \right) \left( \prod_{j=2}^{k} q_j(u) \right)$$

where $a(u) = (1 - u)[1 - (r + s - 1)u + (rs - (n - 1)(k - 1))u^2 - (n + s - 1)(k + r - 1)u^3],

p_i(u) = 1 - \lambda_i u + (r - 1 + k)u^2$ and $q_j(u) = 1 - \theta_j u + (s - 1 + n)u^2$.

Theorem 2.25. Let $G$ be an $r$-regular graph of order $n$ and let $H$ be an $s$-regular graph of order $k$. Then the complexity of the join $G + H$ satisfies

$$\tau_{G+H} = \left( \prod_{i=2}^{n} r + k - \lambda_i \right) \left( \prod_{j=2}^{k} s + n - \theta_j \right),$$

where $\text{Spec}(A_G) = \{\lambda_1 = r, \lambda_2, \ldots, \lambda_n\}$ and $\text{Spec}(A_H) = \{\theta_1 = s, \theta_2, \ldots, \theta_k\}$.

Proof. Let $f(u) = \det \left( I_{n_{G+H}} - uA_{G+H} + u^2(D_{G+H} - I_{n_{G+H}}) \right)$. By Theorem 1.7, we have

$$f'(1) = 2(m_{G+H} - n_{G+H}) \tau(G + H), \quad (2.41)$$

and by [3],

$$f(u) = a(u) \left( \prod_{i=2}^{n} p_i(u) \right) \left( \prod_{j=2}^{k} q_j(u) \right). \quad (2.42)$$

Observe that $a(1) = 0$, $a'(1) = -2k - 2n + nr + ks + 2kn$, $p_i(1) = r - \lambda_i + k$ and $q_j(1) = s + n - \theta_j$. Therefore, by differentiating (2.42) once and set $u = 1$, we have

$$f'(1) = a'(1) \left( \prod_{i=2}^{n} p_i(1) \right) \left( \prod_{j=2}^{k} q_j(1) \right) =$$
Finally, we substitute (2.43) into (2.41) and solve for $\tau(G + H)$. Note that

$$n_{G+H} = n + k$$

and

$$m_{G+H} = \frac{nr}{2} + \frac{ks}{2} + kn.$$ We obtain

$$\tau(G + H) = \frac{a'(1) \prod_{i=2}^{n} p_i(1) \prod_{j=2}^{k} q_j(1)}{2(m_{G+H} - n_{G+H})} = \left(\prod_{i=2}^{n} r + k - \lambda_i\right) \left(\prod_{j=2}^{k} s + n - \theta_j\right).$$

□

With both the Ihara zeta function and the complexity of $G + H$, we are ready to derive the zeta Kirchhoff index:

**Theorem 2.26.** Let $G$ be a $r$-regular graph of order $n$ and let $H$ be a $s$-regular graph of order $k$. Then the zeta Kirchhoff index of the join $G + H$ satisfies

$$Kf^z(G + H) = (k + r - 2)(n + s - 2) + (-2k - 2n + nr + ks + 2kn) \cdot \left[\sum_{i=2}^{n} \frac{r + k - 2}{r - \lambda_i + k} + \sum_{j=2}^{k} \frac{s + n - 2}{s - \theta_j + n}\right],$$

where $\text{Spec}(A_G) = \{\lambda_1 = r, \lambda_2, \ldots, \lambda_n\}$ and $\text{Spec}(A_H) = \{\theta_1 = s, \theta_2, \ldots, \theta_k\}$.

Proof. Again let $f(u) = \det \left( I_{n_{G+H}} - uA_{G+H} + u^2(D_{G+H} - I_{n_{G+H}}) \right)$. By Theorem 1.8, we have

$$f''(1) = 2\left(Kf^z(G + H) + 2m_{G+H}n_{G+H} - 2n^2_{G+H} + n_{G+H}\right)\tau(G + H).$$

(2.44)

We now take the second derivative of $f(u)$ from (2.42) and substitute $u = 1$. Note that $a(1) = 0$, $a'(1) = -2k - 2n + nr + ks + 2kn,$

$$a''(1) = 2(4 - 2r - 2s + rs - 5k - 5n + 3nr + 3ks + 5kn^2),$$

$p_i(1) = r - \lambda_i + k,$

$q_j(1) = s + n - \theta_j$ and $q'_j(1) = -2 + 2s + 2n - \theta_j.$
Therefore, we have

\[ f''(1) = \]
\[ = a''(1) \left( \prod_{i=2}^{n} p_i(1) \right) \left( \prod_{j=2}^{k} q_j(1) \right) + \]
\[ + 2a'(1) \left( \prod_{i=2}^{n} p_i(1) \right) \left( p'_2(1)p_3(1) \cdots p_n(1) + \cdots + p_2(1) \cdots p_{n-1}(1)p'_n(1) \right) + \]
\[ + 2a'(1) \left( \prod_{j=2}^{k} q_j(1) \right) \left( q'_2(1)q_3(1) \cdots q_k(1) + \cdots + q_2(1) \cdots q_{k-1}(1)q'_k(1) \right) = \]
\[ = \left( \prod_{i=2}^{n} p_i(1) \right) \left( \prod_{j=2}^{k} q_j(1) \right) \left( a''(1) + 2a'(1) \sum_{i=2}^{n} \frac{p'_i(1)}{p_i(1)} + 2a'(1) \sum_{j=2}^{k} \frac{q'_j(1)}{q_j(1)} \right) = \]
\[ = 2 \left( \prod_{i=2}^{n} (r + k - \lambda_i) \right) \left( \prod_{j=2}^{k} (s + n - \theta_j) \right) \left[ 4 - 2r - 2s + rs - 5k - 5n + 3nr + 3ks + \right. \]
\[ + 5kn + (-2k - 2n + nr + ks + 2kn) \sum_{i=2}^{n} \frac{2r + 2k - \lambda_i - 2}{r - \lambda_i + k} + \]
\[ + (-2k - 2n + nr + ks + 2kn) \sum_{j=2}^{k} \frac{2s + 2n - \theta_j - 2}{s - \theta_j + n} \right]. \quad (2.45) \]

Now we substitute (2.45) into (2.44), applying Theorem (2.25) and solve for 

\[ Kf^z(G + H): \]

\[ Kf^z(G + H) = \frac{1}{l} \left[ 4 - 2r - 2s + rs - 6k - 6n + 2(k + n)^2 + 3nr + 3ks + 5kn - \right. \]
\[ - (k + n)(ks + n(r + 2k)) \right] + (-2k - 2n + nr + ks + 2kn) \cdot \left[ \sum_{i=2}^{n} \frac{2r + 2k - \lambda_i - 2}{r - \lambda_i + k} + \sum_{j=2}^{k} \frac{2s + 2n - \theta_j - 2}{s - \theta_j + n} \right] = \]
\[ = (k + r - 2)(n + s - 2) + (-2k - 2n + nr + ks + 2kn) \cdot \left[ \sum_{i=2}^{n} \frac{r + k - 2}{r - \lambda_i + k} + \sum_{j=2}^{k} \frac{s + n - 2}{s - \theta_j + n} \right]. \]

Consider the case where \( H = K_1 \). Then the resulting graph is a ‘cone’ with \( G \) as a
base. We have the following corollary.

**Corollary 2.27.** Let $G$ be an $r$-regular graph of order $n$. Then the zeta Kirchhoff index of the cone on $G$ satisfies

$$Kf^2(G + K) = (r - 1) \left[ n - 2 + (nr - 2) \sum_{i=2}^{n} \frac{1}{\gamma_i + 1} \right],$$

where $\text{Spec}(L_G) = \{\gamma_1 = r, \gamma_2, \ldots, \gamma_n\}$.

Proof. It follows immediately from (2.25) by letting $k = 1$ and $s = 0$. $\square$

### 2.9 Line graph of biregular graphs

In Sato’s paper [13], the Ihara zeta function and complexity of the line graph of a biregular graph were derived as follows:

**Theorem 2.28 ([13]).** Let $G = (V_1, V_2)$ be an $(r, s)$-biregular bipartite graph of order $n$, size $m$ where $|V_1| = a$, $|V_2| = b$ and $a < b$. Let $\text{Spec}(A_G) = \{\lambda_1 = \sqrt{rs}, \lambda_2, \lambda_a, 0, \ldots, 0\}$. The Ihara zeta function of the line graph $L(G)$ of $G$ satisfies

$$Z_{L(G)}(u)^{-1} = (1 - u^2)^{ar-r-s+2} g(u) \prod_{i=1}^{a} p_i(u),$$

where

$$g(u) = \left(1 + 2u + (r + s - 3)u^2\right)^{m-1} \left(1 + (2 - s)u + (r + s - 3)u^2\right)^{b-a},$$

$$p_i(u) = 1 + (4 - r - s)u + \left((r - 1)(s - 1) + r + s - 3 - \lambda_i^2\right)u^2 + (r + s - 3)(4 - r - s)u^3 + (r + s - 3)^2u^4.$$

**Theorem 2.29 ([13]).** Let $G = (V_1, V_2)$ be an $(r, s)$-biregular bipartite graph of order $n$, size $m$ where $|V_1| = a$, $|V_2| = b$ and $a < b$. Let $\text{Spec}(A_G) = \{\lambda_1 = \sqrt{rs}, \lambda_2, \lambda_a, 0, \ldots, 0\}$. 
Then the complexity of the line graph $L(G)$ of $G$ satisfies

$$\tau(L(G)) = \frac{1}{a} b^{b-a-1} (r + s)^{m-n+1} \cdot \left( \prod_{i=2}^{a} (rs - \lambda_i^2) \right).$$

We now derive the zeta Kirchhoff index of such a graph:

**Theorem 2.30.** Let $G = (V_1, V_2)$ be a $(r, s)$-biregular graph of order $n$, size $m$ where $|V_1| = a, |V_2| = b$ and $a < b$. Then the zeta Kirchhoff index of the line graph $L(G)$ of $G$ satisfies

$$K_f^z(L(G)) = \frac{a(r + s - 4)^2(r - ar + ar^2 - as)}{r + s} +$$

$$+ ar(r + s - 4)(r^2 + s^2 + 2rs - 4r - 4s) \sum_{i=2}^{a} \frac{1}{rs - \lambda_i^2},$$

where $\text{Spec}(A_G) = \{\lambda_1 = \sqrt{rs}, \lambda_2, \lambda_3, 0, \ldots, 0\}$.

**Proof.** Let $f(u) = \det \left( I_{nL(G)} - uA_{L(G)} + u^2 (D_{L(G)} - I_{nL(G)}) \right)$. By Theorem 1.8, we have

$$f''(1) = 2 \left( K_f^z(L(G)) + 2m_{L(G)}m_{L(G)} - 2n_{L(G)}^2 + n_{L(G)} \right) \tau(L(G)) =$$

$$= 2 \left( K_f^z(L(G)) + m + amr(r + s - 4) \right) \tau(L(G)). \quad (2.46)$$

From Theorem 2.28, we know that

$$f(u) = g(u) \prod_{i=1}^{a} p(u). \quad (2.47)$$

We want to differentiate $f(u)$ twice and substitute $u = 1$. Note that

$$g(1) = r^{b-a} (r + s)^{m-n},$$

$$g'(1) = r^{b-a} (r + s)^{m-n} \left( \frac{2(m-n)(r+s-2)}{r+s} - \frac{(a-b)(2r+s-4)}{r} \right),$$

$$p_1(1) = 0,$$

$$p'_1(1) = (r+s)(r+s-4),$$
\[ p''(1) = 2(16 - 15r + 3r^2 - 15s + 6rs + 3s^2), \]
\[ p_i(1) = rs - \lambda_i^2, \text{ and} \]
\[ p'_i(1) = -2\lambda_i^2 - 4r + r^2 - 4s + 4rs + s^2. \]

Hence (2.48) becomes

\[
f''(1) = 2g'(1)p'_1(1)\prod_{i=2}^{a} p_i(1) + g(1)p''_1(1)\prod_{i=2}^{a} p_i(1) + \]
\[ + 2g(1)p'_1(1)\left(p'_2(1)p_3(1) \ldots p_a(1) + \cdots + p_2(1) \ldots p_{a-1}(1) p'_a(1)\right) = \]
\[ = p'_1(1)\left(\prod_{i=2}^{a} p_i(1)\right) \left[2g'(1) + g(1)\frac{p''_1(1)}{p'_1(1)} + 2g(1)\sum_{i=2}^{a} \frac{p'_i(1)}{p_i(1)}\right] = \]
\[ = (r + s - 4)(r + s)\left(\prod_{i=2}^{a} rs - \lambda_i^2\right) \left[2r{b-a}(r + s)^{m-n}\frac{2(m-n)(r + s - 2)}{r + s} + \right.\]
\[ + \frac{(b-a)(2r + s - 4)}{r} + 2r^{b-a}(r + s)^{m-n}\frac{32 + 6r^2 - 30s + 6s^2 + 6r(2s - 5)}{(r + s - 4)(r + s)} + \]
\[ + 2r^{b-a}(r + s)^{m-n}\sum_{i=2}^{a} \frac{s^2 - 2\lambda_i^2 - 4r + r^2 - 4s + 4rs}{rs - \lambda_i^2} \right] = \]
\[ = 2(r + s - 4)r^{b-a}(r + s)^{m-n+1}\left(\prod_{i=2}^{a} rs - \lambda_i^2\right) \left[\frac{2(m-n)(r + s - 2)}{r + s} + \right.\]
\[ + \frac{(b-a)(2r + s - 4)}{r} + \frac{16 + 3r^2 - 15s + 3s^2 + 3r(2s - 5)}{(r + s - 4)(r + s)} + \]
\[ + \sum_{i=2}^{a} \frac{s^2 - 2\lambda_i^2 - 4r + r^2 - 4s + 4rs}{rs - \lambda_i^2} \right]. \quad (2.48) \]

Now, by we substitute (2.48) into (2.46) and apply Theorem 2.29. Then we solve for \(Kf^z(L(G))\), and get

\[
Kf^z(L(G)) = ar(r + s - 4)\left[\frac{2(m-n)(r + s - 2)}{r + s} + \frac{(b-a)(2r + s - 4)}{r} + \right.\]
\[ + \frac{16 + 3r^2 - 15s + 3s^2 + 3r(2s - 5)}{(r + s - 4)(r + s)} + \sum_{i=2}^{a} \frac{s^2 - 2\lambda_i^2 - 4r + r^2 - 4s + 4rs}{rs - \lambda_i^2} \right] - \]
\[ - \left(m + amr(r + s - 4)\right) = \]
\[
\begin{align*}
\frac{a(r+s-4)^2(r-ar+ar^2-as)}{r+s} + \\
\frac{ar(r+s-4)(r^2+s^2+2rs-4r-4s)}{(r+s-4)} \sum_{i=2}^{a} \frac{1}{rs - \lambda_i^2}.
\end{align*}
\]

Observe that the resulting line graph \( L(G) \) is a regular graph of regularity \((r+s-2)\), hence we can derive the Kirchhoff index of \( L(G) \).

**Corollary 2.31.** Let \( G = (V_1, V_2) \) be an \((r,s)\)-biregular bipartite graph of order \( n \), size \( m \) where \(|V_1| = a\), \(|V_2| = b\) and \( a < b \). Then the Kirchhoff index of the line graph \( L(G) \) of \( G \) satisfies

\[
Kf(L(G)) = \frac{a(r-ar+ar^2-as)}{r+s} + \frac{ar(r^2+s^2+2rs-4r-4s)}{r+s-4} \sum_{i=2}^{a} \frac{1}{rs - \lambda_i^2},
\]

where \( Spec(A_G) = \{\lambda_1 = \sqrt{rs}, \lambda_2, \lambda_a, 0, \ldots, 0\} \).
CHAPTER 3
ZETA KIRCHHOFF INDEX OF SELECTED FAMILIES OF GRAPHS

3.1 Cycle graphs

A cycle graph $C_n$ where $n \geq 3$, is a connected 2-regular graph. By [1, 9], the Kirchhoff index of $C_n$ is given as

$$K_f(C_n) = \frac{n(n - 1)(n + 1)}{12},$$

hence by Theorems 2.3 and 2.13, we can derive the following corollaries.

**Corollary 3.1.** For $n \geq 3$, the zeta Kirchhoff index of cycle graph $C_n$ is 0.

Proof. Since $C_n$ is 2-regular, $K_f^z(C_n) = 0^2 K_f(C_n) = 0$. □

**Corollary 3.2.** Let $C_n$ be a cycle graph with $n \geq 3$. Then the zeta Kirchhoff index of its $k$-th semitotal point graph $R^k(C_n)$ satisfies

$$K_f^z(R^k(C_n)) = \frac{2k^2 n(n - 1)(n + 1)}{3(2 + k)}.$$

**Corollary 3.3.** Let $C_n$ be a cycle graph with $n \geq 3$. Then the zeta Kirchhoff index of its middle graph $M(C_n)$ satisfies

$$K_f^z(M(C_n)) = \frac{2n(n - 1)(n + 1)}{9}.$$

3.2 Complete graphs

A complete graph $K_n$ is a connected $(n - 1)$-regular graph such that every vertex
is adjacent to all the other \((n - 1)\) vertices. By [11], the Kirchhoff index of \(K_n\) is given as

\[
Kf(K_n) = n - 1,
\]

therefore we can easily derive the following corollaries by Theorems 2.3 and 2.13,

**Corollary 3.4.** Let \(K_n\) be a complete graph. Then the zeta Kirchhoff index of \(K_n\) satisfies

\[
Kf^z(K_n) = (n - 1)(n - 3)^2.
\]

**Corollary 3.5.** Let \(K_n\) be a complete graph. Then the zeta Kirchhoff index of its \(k\)-th semitotal point graph \(R_k(K_n)\) satisfies

\[
Kf^z(R_k(K_n)) = \frac{2(n - 1)\left(k(n - 1) + n - 3\right)^2}{2 + k}.
\]

Note that for a complete graph \(K_n\), its quasitotal graph \(QT(K_n)\) is equivalent to its middle graph \(M(K_n)\), hence

**Corollary 3.6.** Let \(K_n\) be a complete graph. Then the zeta Kirchhoff indices of its middle graph \(M(K_n)\) and quasitotal graph \(QT(K_n)\) are equal and satisfy

\[
Kf^z(M(K_n)) = Kf^z(QT(K_n)) = \frac{n^6 - n^5 - 15n^4 + 27n^3 + 10n^2 - 18n - 4}{2n}.
\]

### 3.3 Biregular graphs

A semiregular bipartite graph, or biregular graph \(G = (V_1 \cup V_2, E_G) = (V_1, V_2)\) of order \(n\), size \(m\) is a graph such that there is a partition of sets of vertices \(V_1\) and \(V_2\) that satisfies: (i) \(|V_1| = a, |V_2| = b\) where \(a < b\); (ii) \(\forall v_i \in V_1, \deg v_i = r\) and \(\forall v_j \in V_2, \deg v_j = s\); (iii) all vertices in \(V_1\) are not incident to each other, similarly for all vertices in \(V_2\).
Hashimoto derived the Ihara zeta function of a biregular bipartite graph as follows:

**Theorem 3.7 ([8]).** Let $G = (V_1, V_2)$ be an $(r, s)$-biregular bipartite graph of order $n$, size $m$ where $|V_1| = a$, $|V_2| = b$, $a < b$ and $\text{Spec}(A_G) = \{\pm \lambda_1 = \sqrt{rs}, \pm \lambda_2, \ldots, \pm \lambda_a, 0, \ldots, 0\}$. The Ihara zeta function of $G$ satisfies

$$Z_G(u)^{-1} = (1 - u^2)^{m-n} h(u) \prod_{i=1}^{a} p_i(u),$$

where $h(u) = (1 + (s-1)u^2)^{b-a}$, $p_i(u) = 1 - \left( \lambda_i^2 - (r-1) - (s-1) \right) u^2 + (r-1)(s-1)u^4$.

The complexity of a biregular bipartite graph is given as follows:

**Theorem 3.8 ([13]).** Let $G = (V_1, V_2)$ be an $(r, s)$-biregular bipartite graph of order $n$, size $m$ where $|V_1| = a$, $|V_2| = b$, $a < b$ and $\text{Spec}(A_G) = \{\pm \lambda_1 = \sqrt{rs}, \pm \lambda_2, \ldots, \pm \lambda_a, 0, \ldots, 0\}$. The complexity of $G$ satisfies

$$\tau(G) = \frac{s^{b-a}}{2(a(r-1) - b)} \left( 2rs - 2r - 2s \right) \left( \prod_{i=2}^{a} rs - \lambda_i^2 \right).$$

Next, we derive the zeta Kirchhoff index of a biregular bipartite graph:

**Theorem 3.9.** Let $G = (V_1, V_2)$ be an $(r, s)$-biregular graph of order $n$, size $m$ where $|V_1| = a$, $|V_2| = b$, $a < b$ and $\text{Spec}(A_G) = \{\pm \lambda_1 = \sqrt{rs}, \pm \lambda_2, \ldots, \pm \lambda_a, 0, \ldots, 0\}$. Then the
Zeta Kirchhoff index of $G$ satisfies

$$Kf^z(G) = (a + b)(2a + 2b - ar - bs - 1) +$$
$$+ (a(r - 1) - b) \left( \frac{4(b - a)(s - 1)}{s} + 4a + 1 + \frac{4}{rs - r - s} \right) +$$
$$+ 4(a(r - 1) - b)(r + s - rs) \left( \sum_{i=2}^{a} \frac{1}{\lambda_i^2 - rs} \right).$$

Proof. Let $f(u) = \det \left( I_{nG} - uA_G + u^2(D_G - I_{nG}) \right)$. By Theorem 1.8, we have

$$f''(1) = 2 \left( Kf^z(G) + 2mn - 2n^2 + n \right) \tau(G), \quad (3.1)$$

and by Theorem 3.7,

$$f(1) = h(u) \cdot \prod_{i=1}^{a} p_i(u). \quad (3.2)$$

Note that $h(1) = s^{b-a}$, $h'(1) = 2(b - a)(s - 1)s^{b-a-1}$, $p_1(1) = 0$,
$p'_1(1) = 2(-r - s + rs)$, $p''_1(1) = 2(4 - 5r - 5s + 5rs)$, $p_i(1) = rs - \lambda_i^2$ and
$p'_i(1) = -2(\lambda_i^2 + r + s - 2rs)$.

Hence by differentiating (3.2) twice and substituting $u = 1$, we obtain

$$f''(1) = h'(1)p'_1(1)p_2(1) \cdots p_a(1) + \left( h'(1)p'_1(1)p_2(1) \cdots p_a(1) + h(1)p''_1(1)p_2(1) \cdots p_a(1) +
        + h(1)p'_1(1)p'_2(1)p_3(1) \cdots p_a(1) + \cdots + h(1)p'_1(1)p_2(1) \cdots p_{a-1}(1)p'_a(1) \right) +$$
$$+ h(1)p'_1(1)p'_2(1)p'_3(1) \cdots p_a(1) + \cdots + h(1)p'_1(1)p_2(1) \cdots p_{a-1}(1)p'_a(1) =$$
$$= 2h'(1)p'_1(1) \left( \prod_{i=2}^{a} p_i(1) \right) + h(1) \left( \frac{p''_1(1)}{p'_1(1)} \right) p'_1(1) \left( \prod_{i=2}^{a} p_i(1) \right) +$$
$$+ 2h(1)p'_1(1) \left( \prod_{i=2}^{a} p_i(1) \right) \sum_{i=2}^{a} \frac{p'_i(1)}{p_i(1)}$$
$$= p'_1(1) \left( \prod_{i=2}^{a} p_i(1) \right) \left( 2h'(1) + h(1) \frac{p''_1(1)}{p'_1(1)} + 2h(1) \sum_{i=2}^{a} \frac{p'_i(1)}{p_i(1)} \right) =$$
Finally, we substitute (3.3) and complexity (by applying Theorem 3.8) into (3.1) and solve for $Kf^z(G)$. We obtain:

$$Kf^z(G) = (a + b)(2a + 2b - ar - bs - 1) +$$
$$+ (a(r - 1) - b) \left( \frac{4(b - a)(s - 1)}{s} + 5 + \frac{4}{rs - r - s} \right) +$$
$$+ 2(a(r - 1) - b) \left( \sum_{i=2}^{a} \left( 2 + \frac{2(r + s - rs)}{\lambda_i^2 - rs} \right) \right) =$$
$$= (a + b)(2a + 2b - ar - bs - 1) +$$
$$+ (a(r - 1) - b) \left( \frac{4(b - a)(s - 1)}{s} + 4a + 1 + \frac{4}{rs - r - s} \right) +$$
$$+ 4(a(r - 1) - b)(r + s - rs) \left( \sum_{i=2}^{a} \frac{1}{\lambda_i^2 - rs} \right),$$

as desired. \qed

3.4 Complete bipartite graphs

A complete bipartite graph $K_{n_1,n_2}$ is a graph of order $n_1 + n_2$ where vertices can be divided in two groups: one with $n_1$ vertices and the other with $n_2$, such that all vertices in the same group are not adjacent to one another but is adjacent to all vertices
in the other group. By [18], the Kirchhoff index of $K_{n_1,n_2}$ satisfies

$$Kf(K_{n_1,n_2}) = \frac{(n_1 + n_2 - 1)(n_1^2 + n_2^2) - n_1n_2}{n_1n_2}.$$  

Hence, if $n_1 = n_2 = n$, then

$$Kf(K_{n,n}) = 4n - 3,$$

and again by Theorems 2.3 and 2.13 we have the following corollaries.

**Corollary 3.10.** Let $K_{n,n}$ be a complete bipartite graph of order $2n$. Then the zeta Kirchhoff index of its $k$-th semitotal point graph $R^k(K_{n,n})$ satisfies

$$Kf^z(R^k(K_{n,n})) = \frac{2(4n - 3)(kn + n - 2)^2}{2 + k}.$$

**Corollary 3.11.** Let $K_{n,n}$ be a complete bipartite graph of order $2n$. Then the zeta Kirchhoff index of its middle graph $M(K_{n,n})$ satisfies

$$Kf^z(M(K_{n,n})) = \frac{2(n^6 + 3n^5 - 7n^4 - 14n^3 + 17n^2 + 14n - 12)}{1 + n}.$$
CHAPTER 4
ENUMERATION

For simple connected md2 (minimal degree 2) graphs of degree at most 10, we have computed the Ihara zeta function, Kirchhoff indices, and the characteristic polynomials for their adjacency, Laplacian and normalized Laplacian matrices up to degree 10 by using Wolfram Mathematica. We provide a data summary as shown below.

</table>
We have found a pair of non-isomorphic simple connected md2 graphs of order 9 (see Figure 4.1) where the two graphs have equal Ihara zeta function, all Kirchhoff indices as well as identical characteristic polynomials of the adjacency, Laplacian and normalized Laplacian matrices. We have

\[ Z_{A_1}(u)^{-1} = Z_{A_2}(u)^{-1} = (1 - u^2)^9 \left( 1 + 9u^2 - 14u^3 + 15u^4 - 184u^5 - 146u^6 - 1098u^7 ight. \\
\left. - 957u^8 - 3870u^9 - 2482u^{10} - 8666u^{11} - 2055u^{12} - 11744u^{13} \\
+ 5595u^{14} - 7560u^{15} + 17604u^{16} + 15552u^{18} \right), \quad \tau_{A_1} = \tau_{A_2} = 9840, \]

\[ \rho_{A_1}(x) = \rho_{A_2}(x) = -8 - 12x + 46x^2 + 62x^3 - 60x^4 - 67x^5 + 14x^6 + 18x^7 - x^9, \]

\[ \rho_{L_{A_1}}(x) = \rho_{L_{A_2}}(x) = -88560x + 187812x^2 - 168450x^3 + 83826x^4 - 25393x^5 \\
+ 4806x^6 - 556x^7 + 36x^8 - x^9, \]

where \( \rho_{A_1}(x), \rho_{A_2}(x), \rho_{L_{A_1}}(x), \rho_{L_{A_2}}(x) \) are the characteristic polynomials of the adjacency and Laplacian matrices of \( A_1 \) and \( A_2 \) in terms of \( x \). For the Kirchhoff indices,
we have

$$Kf^z(A_1) = Kf^z(A_2) = \frac{28813}{410}, \quad Kf(A_1) = Kf(A_2) = \frac{15651}{820},$$
$$Kf^+(A_1) = Kf^+(A_2) = \frac{246217}{1640}, \quad Kf^x(A_1) = Kf^x(A_2) = \frac{241239}{820}.$$

To see that $A_1$ and $A_2$ in Figure 4.1 are non-isomorphic, we pick out the two vertices in each graph with degree 3 and name them $a_1$ and $a_2$. Since they have degree 3, they are adjacent to exactly 3 vertices; we name the 3 vertices that are adjacent to $a_1$ as $b_1, c_1, d_1$, where the degree of $b_1$ is 5. Similarly, we name the 3 vertices adjacent to $a_2$ as $b_2, c_2, d_2$, where the degree of $b_2$ is 5. Note that in graph $A_1$, $c_1$ and $d_1$ are non-adjacent as well as $c_2$ and $d_2$ (in another words, $a_1, c_1, d_1$ and $a_2, c_2, d_2$ are not). However, in graph $A_2$, $c_1$ and $d_1$ are adjacent as well as $c_2$ and $d_2$. A further evidence to see that $A_1$ and $A_2$ are non-isomorphic is to observe that in graph $A_1$, $b_1, b_2$ are adjacent to $c_1, d_1$ and $c_2, d_2$, while in $A_2$ this does not hold.

Figure 4.1: Non-isomorphic graphs $A_1$ and $A_2$ of degree 9 with identical Ihara zeta function, adjacency/Laplacian spectrum and Kirchhoff indices.
For graphs of order 10, we have found 4311 pairs and 4 triplets (see Figures 4.2, 4.3, 4.4, 4.5) that have the same Ihara zeta function, all Kirchhoff indices as well as identical characteristic polynomials of the adjacency, Laplacian and normalized Laplacian matrices.

For $B_1, B_2, B_3$ in Figure 4.2, we have

$$Z_{B_1}(u)^{-1} = Z_{B_2}(u)^{-1} = Z_{B_3}(u)^{-1} = (1 - u^2)^{15}(1 + 15u^2 - 28u^3 + 38u^4 - 660u^5$$
$$- 874u^6 - 7000u^7 - 10291u^8 - 43472u^9 - 54345u^{10} - 171072u^{11}$$
$$- 156328u^{12} - 427520u^{13} - 194704u^{14} - 629760u^{15} + 184576u^{16} + 156328u^{17} + 950272u^{18} + 983040u^{20}),$$

$$\rho_{A_{B_1}}(x) = \rho_{A_{B_2}}(x) = \rho_{A_{B_3}}(x) = 128x^2 - 112x^3 - 204x^4 + 118x^5 + 117x^6$$
$$- 28x^7 - 25x^8 + x^{10},$$

$$\rho_{L_{B_1}}(x) = \rho_{L_{B_2}}(x) = \rho_{L_{B_3}}(x) = -3328200x + 5927305x^2 - 4631838x^3 + 2085186x^4$$
$$- 596152x^5 + 112279x^6 - 13934x^7 + 1099x^8 - 50x^9 + x^{10},$$

and for the Kirchhoff indices, we have

$$Kf^z(B_1) = Kf^z(B_2) = Kf^z(B_3) = \frac{291034}{1849},$$

$$Kf(B_1) = Kf(B_2) = Kf(B_3) = \frac{1185461}{66564},$$

$$Kf^+(B_1) = Kf^+(B_2) = Kf^+(B_3) = \frac{5899615}{33282},$$

$$Kf^x(B_1) = Kf^x(B_2) = Kf^x(B_3) = \frac{7333460}{16641}.$$

To see that $B_1, B_2$ and $B_3$ are non-isomorphic, we first label the only vertices of degree 4 and 6 as $a$ and $b$. There is exactly one vertex that is adjacent to both $a$ and $b$; we label this vertex $c$. Now, besides vertices $a$ and $b$, there is one vertex that is adjacent to $c$ and not adjacent to either $a$ or $c$; we label this vertex $d$. Finally, among the vertices adjacent to $d$ besides $c$, there is exactly one vertex that is not adjacent to $b$; we label this
vertex $e$.

Note that in graph $B_2$, $c$ and $e$ are adjacent but they are not adjacent in $B_1$ and $B_3$. Hence $B_2$ is not isomorphic to $B_1$ and $B_3$. There are exactly 3 vertices that are adjacent to both $c$ and $e$ in $B_3$ but there are 4 such vertices in $B_1$. Hence $B_1$ and $B_3$ are not isomorphic.
Figure 4.2: First triplet of non-isomorphic graphs $B_1$, $B_2$ and $B_3$ of degree 10 with identical Ihara zeta function, adjacency/Laplacian spectrum and Kirchhoff indices.
Figure 4.3: Second triplet of non-isomorphic graphs $C_1$, $C_2$ and $C_3$ of degree 10 with identical Ihara zeta function, adjacency/Laplacian spectrum and Kirchhoff indices.

Figure 4.4: Second triplet of non-isomorphic graphs $D_1$, $D_2$ and $D_3$ of degree 10 with identical Ihara zeta function, adjacency/Laplacian spectrum and Kirchhoff indices.
Figure 4.5: Fourth triplet of non-isomorphic graphs $E_1$, $E_2$ and $E_3$ of degree 10 with identical Ihara zeta function, adjacency/Laplacian spectrum and Kirchhoff indices.
