A SHEEP'S BRAIN WITHOUT A CORPUS CALLOSUM.

H. A. SCULLEN.

The brain in question was one from a shipment of dissecting material purchased from the Western Biological Supply Company of Omaha, Nebraska.

It will be seen from the illustration that the entire Corpus callosum and the posterior two-thirds of the Fornix are lacking. Lying between the membranes which form the only wall between the Diacoele and the Paracoele may be seen a slender cord of alba nearly round and about one-fourth of a millimeter in diameter. The connection of this cord seems to be such that it should be considered Fornix and not Corpus callosum. The remaining commissures and all other parts of the brain seem to be normal.

The author has had occasion to examine between two and three hundred sheep brains in the past four years and to date no other abnormality has been noted. So far as is known no other similar abnormality has been reported.

DEPARTMENT OF ZOOLOGY,
IOWA STATE COLLEGE.
